Great Britain.—From the early days of the 19th century, up to 1946, no decade witnessed such immense progress in the spirit and practice of medicine in industry as the years 1937-46. It was a time of great legislative acts, rapid advances in research and the application of the newer knowledge, a wider dissemination of the newer knowledge by means of publications and congresses, the establishment of university chairs and readerships in social medicine and industrial health and the further recognition by governments, managements, trade unions and men of the value of health in work. The greatest significant development of the period was the recognition of the individual worker not as an impersonal physical cog in a great machine but rather as an individual, capable of successful integration into a harmonious healthy community. The Factories act of 1937 became the prototype for good industrial legislation throughout the world. It indicated in the sections dealing with health, safety and welfare the importance of the health of the individual and the group. These models of progressive industrial legislation saw during World War II some abrogation of certain sections, in particular those dealing with hours of work and the employment of women. As a measure of the significance of the application of the law and good industrial medicine to wartime activities, it should be mentioned that the mortality rate from such a disease as T.N.T. poisoning was less than 20% of that experienced in the four years of World War I. The Annual Report of the chief inspector of factories and the ministry of labour and national service illustrated the very considerable advances made in the prevention of disease in industry. An even healthier sign was the effort of employers, both great and small, to produce optimum conditions of work rather than the minimum laid down by the state.

Of equal significance with the passing of acts of parliament in the evolution of new legislation was the development of university departments dealing with social medicine and industrial health. The first great school initiated at Harvard in 1918 remained a pattern for the whole

world. The years 1937–46 saw the development and expansion of university departments both on the continent and in the British commonwealth. The progress from the beginning of the century was slow, but the rapidity with which the wider problems of social and industrial medicine received university attention in the decade augured well for the future health of all industrial communities. The universities and research institutions recognized that their departments would in time become advisers to governments and industry on the wider problems of environment, plant and factory design, amenities and the complex aspects of management and research.

There was a growing interest in the psychology of the worker, the correct selection of the individual for his job, the analysis of his job and the psychological environment in which his task was performed; and industry received a great lead from those experienced psychologists who were responsible for the selection and placing of service personnel. There was at the same time a considerable development in the application of research to industrial problems. Much of this research was in terms of toxicology and the application of the knowledge gained to the immediate problems of industry; the almost world-wide problem of silicosis received much attention. The one black spot was the still high incidence of those diseases of the lung which affect coal miners, and are known under the generic term of pneumoconiosis.

Rehabilitation of the injured or sick worker was among. the most important developments in industrial health schemes. The various compensation acts were such that to a great extent they had blinded both medicine and management to the possibilities of rapid recovery and early return to work. For too long the capacity of the sick and injured person, and indeed of the cripple, to perform a useful task in society was seriously underrated. Official committees investigated the problem and industry faced its responsibilities by establishing within its own structure the means for assisting in the rehabilitation of the sick and injured worker. Great Britain made great practical progress in rehabilitation and the employment of disabled persons by the passing of the Disabled Persons' act of 1944. The health of the industrial population during World War II was maintained in the most remarkable manner by the provision of the factory canteen. (See also Accidents; DERMATOLOGY; MEDICINE.)

Industrial Production

See Business Review; War Production.

Industrial Research

Industrial research is one of the major sources of new additions to national economy. Its developments contribute to the improvement of existing industries and to the creation of new industries. When the findings of industrial research are translated into production, the result may be new employment opportunities for labour, greater stability for business and new or better products and services for the consumer.

By the end of the decade 1937–46, the systematic application of scientific knowledge and methods to the solution of industrial problems had become the principal organized research activity of the United States, exclusive of that undertaken for the government in time of war. Between 1937 and 1946, the scope of industrial research in the United States more than doubled; the number of laboratories grew from about 1,500 to more than 2,400, employment went up from about 40,000 to more than 85,000, and expenditures were increased from \$152,000,000 to over \$400,000,000. (See Table I.)

Prior to 1875 there were few, if any, industrial research laboratories in the 1946 sense of the term. In the following decades, however, several new industries, particularly the electrical industry, adopted energetic programs of research and development. The first of these was probably the laboratory of Thomas Edison at Menlo Park, N.J., established in 1876. This was followed by the General Electric laboratory in 1901, the du Pont Eastern laboratory in 1902, the General Motors laboratories in 1910, the Eastman Kodak laboratory in 1913, and the Westinghouse laboratory in 1917.

World War I acted as a major stimulus to the growth of industrial research in the United States by demonstrating the nation's dependence on German technology, particularly for chemicals, dyes, drugs and optical glass. Much of the U.S. chemical industry, with its extensive research facilities, grew up in response to needs which had been revealed by that war. By 1920, the number of industrial laboratories had increased to about 300, with some 6,000 technicians and scientists, two-thirds of whom were employed in the electrical, chemical and rubber industries.

Following World War I, research became an indispensable function of those progressive industries which sought to maintain or improve their position by more efficient production and new or improved products. The steady growth in industrial laboratories was interrupted only between the years 1931 and 1933, when the business depression caused a reduction from 1,622 laboratories in 1931 to 1,455 laboratories in 1933. By 1935, however, this loss had been regained, and the upward trend was maintained without further reversal throughout the decade 1937–46.

The decade was certainly the most active and productive in the history of U.S. industrial research. United States participation in World War II, in particular, brought about a tremendous acceleration in engineering development, improvement in equipment, and translation of designs to quantity production through the large-scale sponsoring of research by government agencies. The Office of Scientific Research and Development, established in June 1941, sponsored research on war implements and processes for producing them. The Office of Production Research and Development of the War Production board, created in Nov. 1942, sponsored research on war materials. The U.S. war and navy departments enormously expanded their

peacetime research activi-

As a result, government expenditures for research increased from approximately \$69,000,000 in 1940 to an estimated \$720,000,000 in 1944 (see Table I), approximately half of this increase going to finance research on war problems "farmed out" on contract to industrial laboratories.

Despite the fact that much of the research of the decade was of a military character, many of the more outstanding developments of the period had important peacetime potentials. The development of atomic fission, for example, was tremendously accelerated by its imagination-staggering power as a weapon; the same power was applicable to peacetime pursuits, and research to this end was in progress. Similar important peacetime potentials were offered by atabrine, radar, jet engines, high-octane gasolines, synthetic rubber and many other war-sponsored developments.

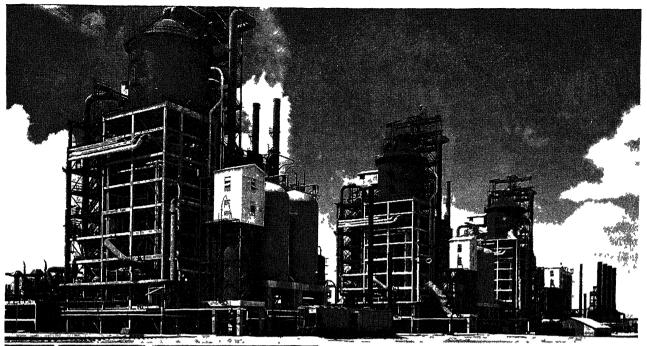

It is axiomatic that the largest and most active industrial research programs are supported by those industries which were themselves created by industrial research. Surveys during the latter part of the decade showed that nearly 70% of all research workers were employed in the chemical, petroleum, electrical communication, electrical manufacturing, machinery, rubber and automotive industries. While the chemical industry spent more than 3% of its net sales income on research, and the metal-working industries about 1%, it was interesting to note that about 98.5% of all manufacturers spent practically nothing on research.

While, in general, the largest research staffs were supported by the larger, progressive companies, considerable progress was noted in making the benefits of research available to smaller companies through the establishment of nonprofit research institutes. In general, such institutes were privately endowed organizations undertaking specific research projects at the behest of various companies who paid direct personnel and out-of-pocket expenses allocatable to their projects. Prominent among such organizations were the Mellon institute (founded in 1911), the Battelle Memorial institute (1929), and the Armour Research foundation (1936). The organization of two new research institutes-the Southern Research institute and the Midwest Research institute-was announced during World War II. A number of additional institutes were proposed for establishment in the postwar period.

Similar research institutes, making research available to small companies and enterprising individuals, were established by the engineering schools of several universities. Examples were Ohio State university, Purdue university, and the University of Michigan.

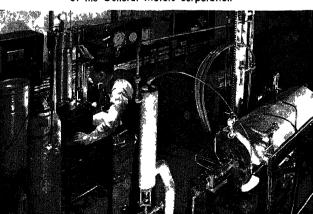

Along with the growth of research institutes, both independent and in conjunction with engineering schools, there was a notable increase in research supported by industrial associations made up of a number of companies which had grouped themselves together to solve problems common to all. Noteworthy examples of such industrial associations were the Portland Cement association, the Bituminous Coal Research, Inc., the Grey Iron Research institute, the Alloy Castings institute, the Copper and Brass Research association and others.

A particularly noteworthy aspect of research during the

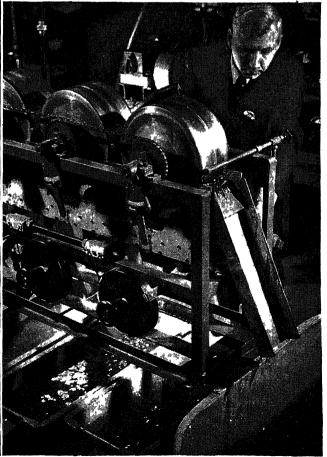

Below: Experimental plant for the production of triptane, an anti-knock motor fuel. The plant was staffed by research scientists of the General Motors corporation

Above: Three fluid catalytic cracking units and a catalytic gas fractionation unit operated by the Cities Service company

Left: The electron microscope, capable of magnifying up to 200,-000 diameters. Seated before the instrument are its co-inventers, Vladimir K. Zworykin (right) and James Hillier

Below: Wet magnetic separator for dividing magnetite from quartz in magnetic iron ore

decade 1937-46; was the increasing recognition of industry's responsibility for basic investigations of a pure scientific character, that is, research directed toward a better understanding of nature and its laws without specific commercial ends. As a matter of interest, it may be observed that the great majority of developments which led to the establishment of successful new industries had resulted from such noncommercial investigations. It was estimated that approximately 5% of the research under prosecution at the end of the decade in industrial laboratories was of this sort; corresponding proportions in government and university laboratories were 15% and 70% respectively.

Research in Iron and Steel.—Among the important results of industrial research in the steel industry during the decade 1937–46, were the development of a number of new alloys offering exceptional forming and drawing properties, high-temperature strength and magnetic permeability. At the same time there was a steady improvement in the quality of many traditional products. As a valuable adjunct to these practical developments, noteworthy progress was also made in studying the equilibrium and isothermal transformation behaviour of iron-carbon-alloy solutions and in arriving at a better understanding of the complex structure of ferrous materials.

One of the most impressive developments in alloying was the rapid creation of an entire new system of alloy steel specifications, the so-called national emergency (NE) steels. Developed as a war measure to increase the output of alloy steel despite curtailed supplies of many important alloying elements, NE steels reduced the requirement for scarce alloying elements by making use of the fact, established from end-quench hardenability studies, that small quantities of several elements are often more effective than a large quantity of one element, and that the more plentiful elements can often replace scarce elements when proper heat-treatment is used. In actual practice, the new specifications reduced the requirements for nickel, molybdenum and chromium to the extent that a large part of the need could be met from the alloy content of available steel scrap; the NE 8600, 8700, and 9400 series, for example, were alloyed almost entirely with selected scrap.

Considerable interest was noted in the investigation of extremely small quantities (less than 0.01 of 1%) of alloying materials. The effect of small additions of tellurium (0.005%) in reducing the annealing cycle of malleable iron was announced in 1937. Similar amounts of boron were found to overcome the stabilizing effect of small amounts of residual chromium which finds its way via scrap into malleable iron castings. A later development in this field was the discovery that boron in amounts as small as 0.0006% is effective in increasing the hardenability of many types of steel from carbon through nearly the entire alloy range, especially the leaner NE alloys. Optimum results were obtained from 0.001% to 0.003% boron; more than 0.003% made hot-working difficult.

Research on alloys capable of withstanding high stresses at elevated temperatures was stimulated by the trend to higher temperatures and pressures in steam engineering, in the cracking and processing of gasoline and by such high-temperature mechanisms as the turbo-supercharger and jet engine for aircraft. Highly-alloyed stainless steels such as 18-8 (18% chromium-8% nickel) had been used in steam turbine blading as early as 1927; these alloys were improved by the addition of molybdenum and tungsten to enhance high-temperature strength and of columbium and titanium to reduce embrittlement and intergrannular de-

terioration. Later developments were more complex alloys, containing chromium, nickel, molybdenum, tungsten, titanium and columbium for use at temperature levels varying between 1,000°F. and 1,800°F. depending on the loads imposed and the service life required. Some of these materials included cobalt-base alloys containing chromium, nickel and molybdenum or tungsten with little or no iron; agehardening nickel-base alloys containing chromium; and chromium-base alloys containing molybdenum and tungsten.

Stabilized nonaging steels for deep-drawing applications had first been announced in 1933. These materials, possessing uniform ductility with improved freedom from stretcher straining, became increasingly important for such severe forming-requirements as automobile fenders and allsteel tops. In 1940, the steel industry produced approximately 1,250,000 tons of these materials.

A later development in electrical steels was oriented cold-reduced silicon steel, in which the grains are oriented in the direction of maximum permeability and minimum hysteresis loss. Possessing magnetic permeability several times that of ordinary hot-rolled non-oriented silicon steel with 50% less hysteresis loss, this material was used in the manufacture of wound transformer cores.

Development in the field of processing techniques was particularly fruitful during the decade. One of the most important advances was the noteworthy improvement in continuous rolling facilities, making available an increased volume of sheet metal and wide strip of improved quality at lower cost, for automobiles, refrigerators, washing machines, stoves, sanitary ware and numerous other products. This development had been extended, in 1936, to the commercial production of flat-rolled galvanized sheet suitable for severe forming and moderately severe drawing. Hot-dipped aluminum-coated steel, produced by an improved process from cold-reduced iron and steel coils, was made available for application in fields where moderate heat and corrosion resistance are required.

Development of processes for concentrating low-grade iron ores received increasing emphasis. Gravity, flotation, magnetic and electrostatic processes were all under comprehensive investigation. Froth flotation, in which various chemicals are utilized to promote the selective adhesion of air bubbles to finely ground iron oxide or waste minerals in the form of an easily separated froth, yielded promising results in a number of separation problems. The diminishing supply of cheap high-grade ore deposits in the United States lent considerable importance and interest to work in this field.

Advances in fabricating techniques were very numerous in the decade, especially during the war-production period. Powdered metallurgy, for many years widely used in forming platinum, tungsten and cemented carbides, was extended to ferrous materials by the development of a number of mechanical, gas reduction, electrolytic, precipitation. condensation and chemical processes for producing finemesh pure iron powder; an important advantage of this process was its economy of metal and labour in finishing operations. Welding grew steadily in importance as a massproduction process; among later developments were the heliarc and pressure welding techniques. A new development in steel casting was the discovery, announced in 1940, that the low ductility of cast steel is apparently due to the presence of certain nonmetallics, particularly manganese sulphide, which can be removed from the melt by proper proportioning of deoxidizing agents and timing of deoxidation. Electropolishing, essentially electroplating in reverse, became a useful process for polishing stainless steel;

unlike mechanical polishing methods, the new process penetrates into pits and depressions, thus giving many materials a brilliant lustre even in the rough state. (See also Iron and Steel.)

Nonferrous Metals.—Enormous demands for aluminum (q.v.) in aircraft production during World War II brought about numerous advances in the production and fabrication of this light metal. Noteworthy developments in production were the introduction of methods for extracting aluminum from lower grade ores and the application of continuous casting to the production of high-quality billets directly from moulten metal. Intensive research led to stronger aluminum alloys—before the war 24S with a tensile strength of 68,000 lb. per sq.in. and, later, alloy 75S with a tensile strength of 82,000 lb. per sq.in. Brazing, a new technique in aluminum fabrication, was made possible by the development of special brazing alloys and suitable fluxes; other developments in fabrication included improvements in riveting and electric welding.

Production of magnesium (q.v.), a metal 35% lighter than aluminum, increased spectacularly during the decade; productive capacity in the United States, only 4,000,000 lb. in 1939, rose to approximately 500,000,000 lb. at the peak of the war production period. At the end of the decade there were two principal processes—electrolytic and thermal. In the electrolytic process, magnesium chloride is reduced to pure magnesium in an electric cell; in the thermal process, magnesium oxide is reduced by carbon or ferrosilicon under high temperature. Sources of raw materials include magnesium chloride brines, magnesite ores, dolomite and sea water. Alloyed with aluminum, zinc, or manganese, magnesium was indispensable as a weight-reducing metal in high performance aircraft. In 1946 the metal was available in cast, sheet, tube and powder form.

An important development in copper (q.v.) technology was the introduction of continuous casting to the production of very dense high-conductivity copper-wire bars. In this process the metal is solidified while being poured or drawn through an aperture of the desired size and shape. In addition to delicate thermal and mechanical control, special oxygen-free atmospheres are required for successful results. Further developments in copper were the production of extremely thin copper sheets by electrodeposition; bi-metal sheets from composite ingots of copper and steel; and beryllium copper alloys, comparable in hardness to some grades of steel, for springs and electrical applications.

Among the newest and most important uses of silver (q.v.) during the decade were silver alloy bearings. The excellent frictional and seizure-resistant properties of silver-rich alloys made them ideal for master rod bearings and other highly-loaded bearings for aircraft engines. In such applications, silver was applied by rolling, silver soldering, casting or electrodeposition to a mild steel backing. For best results, the oxygen content of the silver was kept to a minimum.

Numerous advances were noted in processes for producing nonferrous metal surfaces on steel and other materials. Much interest centred around new processes for tin plating; electrolytic tinning, continuous hot-dip tinning and vapour-phase deposition were greatly improved. Important contributions to these new processes were the use of aluminum in the bath and gaseous fluxes. New processes were announced for aluminum-coated steel, silver-and-coppercoated steel, and beryllium-coated iron and nickel alloys.

Shortages of critical nonferrous metals during the war stimulated extensive research on methods of extracting scarce metals from low-grade domestic and foreign ores. New processes were announced for the production of tin, molybdenum, chromium, manganese, bismuth, antimony and beryllium from U.S. deposits.

Petroleum Industry.-During the decade, the petroleum industry made great strides in the transformation from a relatively simple enterprise for getting oil out of the ground as quickly as possible and separating it into a few saleable fractions, to a more scientific industry for producing spark-ignition engine fuels, lubricants and other products by chemical and physical processes of the utmost complexity. This remarkable transformation, insofar as automotive and aircraft fuels were concerned, was largely the consequence of a few basic discoveries, established as early as 1926, regarding the correlation between molecular structure and the usefulness of pure hydrocarbons as fuels. These discoveries indicated that many hydrocarbons which have branched-chain molecular structure are superior in antiknock quality to those isomers which have straightchain structure and which predominate in the normal gasoline fractions of petroleum.

A major research effort of the decade 1937–46, therefore, was the development of refining processes for producing from crude oil greater amounts of hydrocarbon products possessing these desirable structures which yield higher octane numbers and greater utility. This resulted in the introduction in 1936 of the Houdry fixed-bed catalytic cracking process, in which selective cracking was accomplished by passing preheated vapours through a catalytic reactor chamber. With the outbreak of World War II, the greatly increased demand for aviation gasoline stimulated the development of still better cracking processes. Among these were the fluid catalyst process, announced in 1941, and the new Houdry adiabatic-cracking process, announced in 1942.

Along with this rapid development of improved cracking techniques, there was a large amount of research on processes for synthesizing specific components for blending high-octane gasolines. In 1935, the first 100-octane base fuel (iso-octane) was obtained on a semiworks scale by the polymerization of isobutylene from refinery-cracked gas, followed by hydrogenation; this process went into commercial production in 1937. Catalytic alkylation, a process for combining isoparaffins with olefins to form higher molecular weight compounds of branched-chain structure, was announced in 1938; in this process iso-octane was derived from isobutane and butylenes. This was followed by the announcement of thermal alkylation in 1939; neohexane, an alkylate of high-blending value for aviation gasoline, was produced by this process. Di-isopropyl, used for blending high-octane aviation fuel during the war, was produced in large quantities from ethylene and isobutane by a catalytic alkylation process placed in production in 1944. Isomerization, the rearrangement of hydrocarbons without change in molecular weight, was applied in the conversion of n-butane to isobutane.

In the field of pure synthetic hydrocarbon chemistry, one of the most interesting developments, announced in 1945, was the production of better than 99% pure "triptane" (2,2,3-trimethylbutane) in tank-car quantities. This hydrocarbon, the most highly-branched member of the heptane family, had apparently never been found in naturally-occurring petroleum; it possesses very superior antiknock characteristics and became an outstanding fuel.

Advances in petroleum exploration included topographic and aerial surveying, seismic reflection and gravimetric reconnaissance, and, to a lesser degree, magnetic and chemical survey methods. Considerable interest was shown in

soil gas exploration, where soil gas, existing either free or absorbed in soil particles, was analyzed for very small quantities of hydrocarbons; it was hoped that further development of this method would yield a means of locating oil and gas directly, as contrasted with geophysical methods which simply indicate stratigraphic structures favourable for the accumulation of petroleum. A similar method of exploration involved the examination of soil for certain types of bacteria associated with petroleum.

Important changes were noted in the drilling of oil wells. The cable tool or standard rig, inadequate for deep drilling, was displaced by the rotary drill whose use had been made practical by the development of special drilling muds. High-pressure formations were controlled by extra heavy muds, produced by treating clay slurry with barium sulfate. The application of colloid chemistry to mud treatment resulted in a variety of new muds possessing special viscosity, thixotropic and antiflocculating properties.

The quality of lubricating oils was improved through solvent extraction methods to remove certain compounds responsible for deterioration and, later, through chemical additives to improve oxidation resistance and reduce sludging, varnishing and corrosion. Turbine oils with superior stability and anti-rusting characteristics were also developed.

The manufacture of synthetic materials; other than fuels, from petroleum and natural gas, received a large amount of attention. Alcohols were manufactured from refinery-cracked gases by absorption in sulfuric acid followed by hydrolysis and purification. Acetone was produced from isopropyl alcohol and methyl ethyl ketone from secondary butyl alcohol, through catalytic dehydrogenation. Glycerol was synthesized from propylene. The large scale production of butadiene and styrene for use in synthetic rubber was an outstanding example of petroleum research during this period. (See also Petroleum.)

Rubber.—Foremost among the numerous technological advances of the rubber industry during the decade 1937–46 was the development of a number of synthetic rubber materials. As a result of this forward-looking program, the United States was well prepared to meet the emergency created in 1942 by the Japanese conquest of the major natural-rubber-supplying areas of the world. By 1946, synthetic rubber production had become a major U.S. industry with a capacity of about 1,150,000 long tons annually.

The first attempt to develop rubberlike materials had begun as early as 1875 with efforts to synthesize isoprene, the fundamental molecular constituent of natural rubber. Following the poor success of these pioneer efforts, attention was shifted to non-isoprene synthetics by the discovery in 1901 that both butadiene and dimethyl butadiene could be polymerized into rubberlike solids. Imperfect knowledge of the polymeric reaction impeded further progress, however, so it was not until 1931 that the first commercially-useful material, a polymer of monochlorobutadiene, was introduced under the name duprene (renamed neoprene or GR-M). By 1946, neoprene was being produced at a rate of about 70,000 long tons annually. Thiokol, an organic polysulphide, made its appearance at about the same time. This was followed by the development of koroseal, a rubberlike polymer obtained from vinyl chloride, in 1933.

After 1934 the development of substitutes for natural rubber proceeded at an accelerated rate. Among the first to appear were Buna S and Buna N, obtained by copolymerizing butadiene with styrene and acrylonitrile. Buna S

Rolling an experimental aluminum ingot into sheet

(also called GR-S) was the principal synthetic rubber produced in the United States in 1946; government-owned plants alone had a capacity of over 1,000,000 long tons per year. This material became used as general-purpose rubber in numerous products, including pneumatic tires for automotive vehicles and insulation for wire and cable. Buna N (also GR-N) was being produced entirely in privately-owned plants to the extent of about 18,000 long tons annually; it was used in self-sealing fuel tanks, bulletproof hose and mechanical goods where exceptional resistance to gasoline and oil was required.

A later development, butyl rubber, a copolymer of isobutylene and isoprene, was introduced in 1940; because of its superior impermeability to gases it was an effective material for inner tubes. The capacity for butyl rubber in the United States in 1946 was about 60,000 long tons per year.

A later development in the synthetic-rubber field was a new class of elastic materials derived from silicone resins. These materials, announced in 1945, were unaffected by temperatures ranging as high as 450°F. and as low as -70°F. They were used as gasket materials for aircraft engines, superchargers and searchlights.

Considerable progress was noted in the development of specialty rubber products. Lastex yarn, a product formed by covering rubber thread with cotton, silk and other materials, was made available for use in stretchable fabrics. Latex foam sponge was another specialty product possessing superior cushioning properties for lightweight, self-ventilating mattresses and seat cushions. A number of cyclized rubbers were developed for use as adhesives and paint bases. (See also Rubber.)

Plastics.—The development of the plastics industry, with large-scale production dating back only a few years, was one of the most impressive achievements of modern industrial research. According to the U.S. department of commerce, the production of synthetic resins in the United States increased from 1,644,000 lb. in 1921 to 784,137,000 lb. in 1944, an increase of approximately 47,500%. In addition to the extensive use of plastics in consumer goods, such as household appliances and personal effects, they found important application in many industrial processes as laminating and impregnating resins, adhesives, paper and textile coatings, paint bases and dielectric materials.

In 1846, Christian Friederich Schoenbein produced the first plastic, nitrocellulose, by treating cellulose fibres with nitric acid. This was a material of the thermoplastic type, that is, it does not undergo chemical change in forming and can be softened and reformed under heat and pressure. The commercial development of nitrocellulose began in the U.S. in 1868, when John Wesley Hyatt introduced the material under the name Celluloid. A similar material, cellulose acetate, discovered by Paul Schuetzenberger in 1865, was produced on a small scale in England about the turn of the century.

The remarkable progress of plastics in the 20th century was initiated in 1909, when Leo Baekeland developed the first thermosetting plastic, that is, a material which when formed undergoes chemical change and cannot be softened or reformed by further application of heat and pressure. This material, a product of phenol and formaldehyde, he called Bakelite. Vinyl acetate appeared in 1919, followed by furan in 1920, alkyd and aniline-formaldehyde in 1926, urea-formaldehyde in 1930, acrylic in 1931 and cellulose acetate butyrate in 1932.

During the decade 1937–46, a large number of new and improved plastic materials made their appearance. Among those which became commercially important were: ethyl cellulose (1937), polystyrene (1937), vinyl butyral (1937), melamine-formaldehyde (1939), vinylidene chloride (1939), allyl (1942) and polyethylene (1942). All these new materials possess exceptional properties of colourability, translucency, lightness, flexibility, toughness, adhesiveness, and resistance to electricity, chemicals, abrasion and shock.

A later development were the silicone resins, announced in 1943. Produced from silicon tetrachloride, magnesium and an alkyl halide, these materials were resistant to temperatures ranging as low as -75° F. and as high as 500°F. When used in conjunction with fibre glass as insulation for electric motors, they permitted as much as 50% reduction in weight for the same horsepower. They were also used as high-temperature gasket materials, notably in turbo-superchargers for aviation engines. (See also Plastics Industry.)

Glass.—Glass research entered a new era during the decade. The outstanding accomplishments of the previous decade (1927–1936) were the development of automatic machinery for blowing glass bottles, continuous rolling, grinding and polishing mills for plate glass; vertical drawing equipment for window glass and similar mechanical innovations. In contrast to this period of mechanical development, the later decade was largely a period of chemical development, with the major emphasis on the study of glass composition and its effect on physical properties.

"Shrunk" glass, with properties approaching fused quartz, was produced by separating ordinary glass into two phases, one consisting almost entirely of silica, the other of boric oxide, alkali and other soluble constituents. Leaching with acid gives a microscopically porous product consisting of approximately 96% silica, which on firing contracts about 35% in volume. This material is available in

the form of laboratory ware and high-strength sheets.

Laminated safety glass, introduced in 1927, underwent marked improvement during the decade 1937-46, a notable development being the use of vinyl plastic instead of celluloid or cellulose acetate, which suffered from discoloration and low-temperature embrittlement. The combination of vinyl plastic and plate glass not only provided a safety glass of high strength under all temperature conditions, but was sufficiently yielding to reduce passenger injuries on impact with it. A further development in safety glass, introduced during World War II, was flexseal glass in which the plastic interlayer extends beyond the edge of the glass and serves as a flexible mounting member; stresses caused by flexing the frame are not transferred to the glass itself. This type of mounting was used in aircraft where the incidence of breakage with conventional safety glass would have been prohibitive.

An electrically-conductive coating for anti-icing and antifogging glass was announced in 1946. When applied to laminated safety glass, the conductive coating was found to enhance the impact strength by maintaining the plastic interlayer within the optimum temperature range. The coating is completely transparent and durable; according to reported tests, there was no appreciable change in visual appearance or electrical properties after 70,000 cycles of wiping in the presence of water and dirt.

Nonreflecting surfaces were produced on glass by deposition of evaporated magnesium fluoride, the resulting film being in the order of 0.0000035 in. thick. The process was applied to lenses for range-finders, night binoculars and other optical equipment. Another glass development of importance in the optical field was the successful casting of a 200-in. pyrex mirror, the largest piece of glass ever made, for Mount Palomar observatory in California.

Among the numerous architectural applications of glass was the so-called solar house, with walls largely of glass, so oriented that the infrared rays of sunlight are excluded in summer and utilized for heating in winter. Other novel developments were prefabricated double-glass windows, curved plate glass for store fronts, tempered glass doors, hollow glass building block, heat-absorbing plate glass and high- and low-reflecting glasses. Glass fibre, woven in braid or cloth form, was used as insulation for electric motors and as fireproof drapes for places of entertainment and private homes. (See also GLASS.)

Power Production.—Certainly one of the most active and productive fields of industrial research during the decade was the development of new or better methods of generating power. Steam units were designed to operate in everlarger sizes and at increasingly higher temperatures and pressures. The highly efficient diesel engine became a major source of cheap power for industry and transportation (see Railroads). The continuous-flow gas turbine emerged from the theoretical stage and was applied to aircraft propulsion (see Aviation, Military). Nuclear energy, first utilized as a weapon, offered tremendous potentialities as a source of power for peace (see Atomic Bomb).

Advances in water power were stimulated by large government projects at Boulder dam, Tennessee valley, Bonneville, Grand Coulee and elsewhere. Approximately one-third of U.S. central-station capacity was now derived from water power. An important advance in water-turbine design was the Kaplan turbine, in which the pitch of the blades may be varied for efficient operation under a wider range of water heads than would be possible with fixed-pitch blading. The largest turbines of this type in the

United States were the 66,000-h.p. units at Bonneville dam. Francis reaction-type water wheels were built in sizes up to 108,000 h.p.

Despite the interest aroused by newer methods of power generation, steam continued to be the most important source of power for industrial uses. High-efficiency boilers, now often termed steam generators, were built with steaming capacities up to 1,000,000 lb. of steam per hour; convection surfaces were almost wholly replaced by radiant heating surfaces using vertical tubes which form the walls of the combustion space and in which steam is generated by rapid once-through flow before passing to the separator and superheater.

Steam turbines were developed for operation at progressively higher temperatures and pressures. Units of advanced design were capable of operating at inlet temperatures in the range of 950°F. to 1,000°F. and at pressures of 1,200 to 1,600 lb. per sq.in. These were built in sizes as large as 125,000 kw. and were, in general, used as topping or super-position units, that is, high-pressure turbines which exhaust to low-pressure turbines instead of directly to a condenser. Research was directed toward exploring still higher temperatures and pressures made possible by advances in metallurgy.

After 35 years of development, the mercury-steam plant became a reliable and efficient method of generating power. In a typical plant, mercury vapour at 1,000°F. and 180 lb. per sq.in. was expanded in a mercury turbine to about 485°F. and 1 lb. per sq.in.; it then passed to a mercury condenser-steam generator where it gave up its heat to steam at about 435°F. and 460 lb. per sq.in., which, after superheating, was expanded through a steam turbine to about 80°F. and 0.5 lb. per sq.in. The peak thermal efficiency of such a unit is about 37.5%. Difficulties with overheating of mercury boiler tubes caused by the non-wetting characteristics of mercury on steel were overcome by minute additions of magnesium and titanium as wetting agents. A major limitation on this type of plant was the high capital cost of mercury.

The emergence of the diesel engine as an important source of power for industrial and transportation uses was largely an accomplishment of the decade. The total power of diesel engines produced in the United States in 1937 amounted to only 2,025,000 h.p.; in 1944 production was in excess of 35,000,000 h.p. Noteworthy advances contributing to this growth were the two-stroke cycle with uniflow scavenging, the unit injector and high-speed (up to 2,000 r.p.m.) automotive-type diesels. Because of its very high efficiency (up to 36%), and its dependability, the diesel became a major factor in automotive and rail transportation, marine propulsion, municipal light and power plants, earth-moving and construction machinery and mining and oil-well drilling. During the war period, over 30,000,000 h.p. in diesels were used by the U.S. navy for landing ships and amphibious craft.

Progress in continuous-combustion gas turbines resulted largely from advances in axial-flow compressor design and high-temperature alloys. The conventional gas turbine unit consists essentially of a compressor in which air is compressed to 50 or 75 lb. per sq.in., a combustion space in which fuel is introduced and burned, and finally a turbine in which the potential energy of the hot combustion gases is converted into kinetic energy and subsequently into mechanical energy by passage through a suitable system of blading. Most of the turbine power output (60% to 75%) is absorbed in compressing the inlet air, and hence the net

output available for useful work is the difference between the total power generated by the turbine and the power absorbed by the compressor. The efficiency of the unit therefore depends on the efficiencies of the compressor and the turbine. At the same time, both power and efficiency depend on the temperature of the combustion gases entering the turbine, giving rise to a continuing need for improved alloys to withstand higher operating temperatures. Research in 1946 was directed toward finding alloys that could withstand temperatures of 1,200°F. and higher with acceptable creep and stress-rupture characteristics over long periods of time. Research was also directed toward the utilization of low-cost fuels such as pulverized coal and bunker fuels.

Investigations in nuclear power continued to be supervised by the government, in co-operation with several industrial laboratories, on the operation of a large atomic pilot plant at Oak Ridge, Tenn. Detailed results of this investigation were not yet available at the end of the decade, but it was generally agreed that the first useful atomic power plants would be large, that is, 100,000 to 200,000 kw., because of shielding requirements; and atomic power would be neither so cheap as to obsolesce existing prime movers nor so expensive as to preclude its consideration as a competitor to other forms of power. (See Atomic Bomb.)

Aircraft.—Progress in aeronautics during the decade was perhaps more spectacular than that in any other field. Aircraft were made larger (over 200 tons) and faster (over 600 m.p.h.) than ever before. Developments in air-frames and power plants, on which over-all aircraft progress was directly dependent, proceeded at a phenomenally rapid rate.

Parasitic drag, which seriously limits aircraft speed, was reduced as a result of improved understanding of air flow around air foils, or wings. Considerable progress was noted in approaching a true laminar-flow wing through advanced design and precise construction. There was a large amount of interest in so-called "flying wing" aircraft in which the function of the conventional tail assembly in providing stability and control was achieved by sweeping back the wings and providing them with "elevons" which could be used differentially as ailerons to control roll, or in unison to control pitch.

At speeds above 500 m.p.h., drag becomes an increasingly serious problem because of the compressibility of air; at sonic speed (about 760 m.p.h.) drag reaches a value many times greater than at subsonic speeds. At the end of the decade, aircraft had exceeded a speed of 600 m.p.h., and intensive efforts were being directed toward overcoming the difficulties associated with still higher speeds.

Increases in aircraft speeds toward the supersonic range provided a major stimulus for the development of new methods of propulsion: the turbo-jet engine, the propulsive duct and the liquid rocket motor. The efficiency of propeller propulsion, quite high at moderate subsonic speeds, falls off as speed is increased. The efficiency of jet propulsion, on the other hand, while low at low speeds, increases rapidly with increasing speed. Both jet and propeller are similar in principle: the propeller collects air, accelerates it by the action of the blades, and discharges it to the rear; the turbo-jet collects air through its intake, adds heat energy to it in a combustion chamber, and discharges the combustion gases through an orifice. Turbo-jet engines were limited by the inadequacies of high-temperature metals.

Research on helicopters, which can rise vertically from the ground, hover, descend vertically at will and fly horizontally at reasonably fast speeds, resulted in several sat-

isfactory designs. Interest in this type of aircraft resulted from its ability to land and take off in small spaces in congested areas, making it potentially useful as an air taxi for transporting passengers to and from airports and for possible private flying. (See Aviation, Civil; Aviation, Millitary.)

Automotive Research.—Indicative of the progress of automotive research were the average improvements in economy (ton-mi./gal.) of 47.8% and in performance (brake h.p./cu.in. displacement/ton-mi.) of 29.8% which were effected in volume-production motorcars between the years 1930 and 1942, when automotive production was halted by World War II.

A major trend in automotive research was toward improved riding and driving quality and increased safety. Independent coil spring suspension, the fluid clutch, automatic and semiautomatic transmissions, hypoid gears and increased weight contributed to the improvement of riding quality and easier driving. Among the more important safety developments were the all-steel body, the turret top, sealed-beam headlamps, vinyl safety glass and internal hydraulic brakes. Engine efficiency was increased by raising compression ratios (up 42.5% between 1930 and 1942), which was in turn made possible by higher octane fuels, improved bearing materials and bearing design, and better dynamic balancing and vibration suppression techniques.

In addition to improvements which it made in its own products, the automobile industry provided a major stimulus for the improvement of many products and raw materials of which it was the principal consumer. Co-operative research between automotive and supplier industries resulted in such advances as continuing improvements in the octane quality of fuels, correction of the sludging and corrosive tendencies of lubricants, improvements in the deepdrawing quality of steel sheets, improvements in low-viscosity cellulose nitrate lacquers and other finishes, and the development of progressive dies and improved machine tools. (See also Automobile Industry.)

Railroads.—The railroads were very active in investigating the possibilities offered by various new types of prime movers as power plants for locomotives. Attention was given to improved steam-cylinder locomotives and steam turbine locomotives, diesel locomotives and gas-turbine locomotives. At the same time, there was an increasing emphasis on improved rolling stock, sleeper accommodations, and other developments contributing to passenger service and comfort.

Following the introduction of the first diesel-powered streamlined train (the "Pioneer Zephyr") in 1934, the diesel locomotive rapidly grew to a commanding position in main-line service. Costing more than twice as much per h.p. as the coal-fired steam locomotive, the diesel's higher availability and higher efficiency (approximately 36% as compared to approximately 8% for steam) made it indispensable for high-speed passenger service and for freight and switching. Because of its very high availability in continuous service, one diesel locomotive may often do the work of several steam locomotives. In 1941, when the manufacture of passenger locomotives was halted by the war, there were nearly 200 diesel passenger locomotives in main-line service. The first diesel freight locomotive was demonstrated in 1939; by 1946 there were nearly 300, plus over 80 combination freight and passenger locomotives. In 1936 there were approximately 175 diesel switchers; in 1946, over 2,000.

Development of the steam-turbine locomotive was impeded for many years by condenser difficulties, that is, the difficulty of building a suitably compact condenser to re-

cover boiler water and provide the necessary vacuum at the turbine exhaust. Several experimental locomotives attempting to overcome this difficulty were designed and built during the decade. Attention was also given to the possibility of using non-condensing turbine drives for locomotives.

Interest in the gas turbine, which requires no boiler or condenser, resulted from its potential high efficiency. While these efficiencies had not yet been realized in practice (see above, under Power Production), a 2,200-h.p. gas-turbineelectric locomotive, giving approximately 18% thermal efficiency, had been in operation on the Swiss Federal railways since 1939. Several manufacturers in the United States prepared designs for gas-turbine locomotives, among the most interesting of which was one proposing to use powdered coal as fuel. In this design, coal was to be crushed and atomized to produce particle sizes comparable to lamp black for burning in a vortex-type combustion chamber; the hot combustion gases would pass through a centrifugal ash precipitator in which 95% of the fly-ash was removed; the clean combustion gases would then be expanded in the gas turbine.

The introduction of heavier equipment and faster schedules, made possible by the diesel locomotive, necessitated extensive improvements in rails and roadbeds. The quality of rail steel underwent steady improvement. Methods of detecting rail fissures were developed and placed in use. End batter was reduced by the introduction of hardened 45-degree lapped joints. The number of rail ends was minimized by using continuous rail lengths over a mile long. Processes for hardening rails over their entire length were under investigation; one such process using watermist quenching was in limited use in Europe. A U.S. process, in which the entire rail is water-quenched and normalized, raised the Brinell hardness from 300 to 360 and reduced wear by 45%. (See also RAILROADS.)

Radio and Television.—A continuing trend of radio development was its expansion into increasingly larger portions of the frequency spectrum. This trend, a normal result of the increase in transmitting facilities, was intensified during the decade 1937–46 by the wide-band requirements of frequency modulation (150 kilocycles) and television (over 4 megacycles). Such extremely large bandwidth requirements were accommodated by moving continually higher into the ultrahigh-frequency region.

Formerly, amplitude modulation (A.M.) was the only method employed for radio transmission; frequency modulation (F.M.) was thought to have no outstanding advantage, since the methods of reception were so inefficient that they more than offset the higher efficiency of transmission which resulted from constant-carrier amplitude. With the recognition in 1936 that radio interference from noise was mainly due to amplitude modulation of the carrier, however, interest in F.M. development was greatly stimulated, and it progressed with such rapidity that in 1940 the Federal Communications commission assigned the 42-50 megacycle range to F.M. broadcasting, permitting the accommodation of 40 high-fidelity transmissions separated by 200 kilocycles each. Among the advantages of F.M. over A.M. are higher fidelity, lower transmission power at full modulation, low-level modulation, and less amplitude compression. The disadvantages are unsatisfactory transmission over long ranges requiring multiple ricochets between ionosphere and earth, and a tendency to "capture" signals from other F.M. transmitters operating at the same carrier frequency. (See RADIO.)

Following the development in 1923 of electronic scanning devices (see *Electronics*, following) for modulating a carrier wave with video signals, television made such rapid strides that by 1946 it had reached a state of potential commercialization. By 1940, the number of experimental television broadcasting stations, operating mostly in the New York area, had grown to 23. Authority to begin commercial television broadcasting was granted by the Federal Communications commission on July 1, 1941, but further commercial progress was impeded by U.S. participation in the war. Colour television was demonstrated in 1940 and placed in operation in the New York area in 1941. (See Television.)

Radar (radio detection and ranging) was one of radio's most spectacular wartime applications. First installed on the battleship U.S.S. "New York" in 1938, radar was used to determine the direction and distance of foreign bodies by emitting short-wave pulses reflected back to the sending point after striking a solid object. Direction is obtained directly, while distance is computed from the time lag between pulse emission and reception. The principal advantages of radar over visual and sound detection systems are greater range and accuracy, ability to function in darkness and adverse weather, and vastly increased sensitivity. During World War II, radar was widely used on land to locate aircraft and offshore vessels; on shipboard to determine the position of other ships, aircraft and landmarks; and in aircraft as an absolute altimeter (introduced in 1938) and to locate other aircraft. A proposed peacetime application was in ship and aircraft navigation; several types of equipment were available for this purpose.

Other types of war equipment making use of the reflecting properties of electromagnetic and elastomechanical waves were loran (an aid to long-range navigation), shoran (a precision blind-bombing system) and sonar (a supersonic submarine-locating device). (See also RADAR.)

Electronics.—During the decade, electronics assumed an increasingly important role in modern life, and the spectacular development of new electronic devices continued with unabated progress. In addition to their usefulness in all phases of communication, they became essential in many important industrial processes. As radio-thermic devices, they became invaluable in induction and dielectric heating. They extended the field of resistance-welding. They were introduced to level elevators, control the register of high-speed printing presses, stop papermaking machines at the precise instant before paper fibres break, open and close doors and ring burglar alarms. As rectifiers they supplied 75% of the direct current used by the aluminum and magnesium industries. They sort and count merchandise, match colours, spot pin holes in thin sheets and films, locate occlusions in heavy castings, and gauge the thickness of materials to a millionth of an inch.

A major stimulus to the development of new vacuumtube devices was afforded by the extension of radio into the ultrahigh-frequency portion of the spectra. This resulted in a number of new thermionic devices working on principles which are free of some of the defects suffered by negative-grid tubes at these higher frequencies.

When used as an oscillator, the negative-grid tube becomes progressively less efficient as frequency is increased. At ultrahigh-frequencies, therefore, it was replaced to a very large extent by the positive-grid oscillator, the magnetron and the klystron. The first two of these devices are excellent oscillators but are incapable of amplification. The klystron, using the principle of velocity variation, may

be used either as a high-frequency oscillator or as a high-frequency amplifier.

In high-frequency amplification, the tendency of negative-grid tubes to generate extraneous frequencies by feedback necessitated the development of devices for neutralizing this effect, one such device being the push-pull pentode with two tube structures in one envelope. Amplification by beam-power tubes, an application of electron optics to thermionics, received considerable attention because of its high efficiency. Promising progress was noted also in the development of wide-band amplifier tubes for television and broad-band carrier systems.

Important developments in secondary-emission and photoelectric-emission devices resulted from the need for efficient pick-up tubes for television transmission. Four types of television pick-up tubes were available in 1946: the image dissector, the iconoscope, the super-emitron (or image iconoscope) and the orthicon. On the receiving end, numerous detailed improvements were made in the cathode-ray picture tube, notably the electron gun for producing accurately-focused high-current electron beams and improved fluorescent materials. Considerable interest was centred on the problem of developing a satisfactory brightimage tube capable of projecting television images on a large screen.

Concurrent with the development of new thermionic devices, there was a remarkable advance in circuit techniques. As frequencies increase, the lumped inductances and capacitances of resonance circuits tend to decrease, and the characteristics of the connecting leads assume an increasingly important role in circuit performance. At ultrahigh frequencies, therefore, it was found necessary to abandon lumped circuit constants and to use instead the resonance properties of parallel-wire or coaxial transmission lines. At still higher frequencies, even this type of circuit becomes inefficient and use must be made of the resonance properties of conducting cavities, the frequency then being determined by the geometry of the cavity. This technique found wide application in the newer thermionic devices; the elements of the velocity-modulation and klystron tubes, for example, were set directly into such

One of the most spectacular applications of electronics was the electron microscope, making possible visual magnifications as great as 30,000 diameters, compared to 2,000 diameters for the optical microscope and 3,000 diameters for the ultra-violet ray microscope. This device overcame the limitation imposed on optical microscopes by the wave length of visible light (0.0004 to 0.0008 mm.) which precluded observation of particles separated by a distance of less than 0.0001 mm. By extending the range of observation to particles separated by as little as 0.000002 mm., the electron microscope made it possible to observe large molecules; theoretically it should be possible to see atoms. Important applications were found in the study of viruses, colloids, plastics, catalyzers, surface chemistry, grain structure of metals, paint pigments, ceramics and textiles.

Developments in X-ray equipment extended the range of possible sizes up to and including 2,000,000 volts. In 1946 there were five 2,000,000-volt industrial X-ray units in the United States; with units of this size, satisfactory exposures could be made through 12 in. of steel in about 2 hours. Such equipment became invaluable for inspecting metals and welds in heavy structures such as armour plate, large castings and thick-walled pressure vessels. (See Electronics; X-Ray.)

Textiles.—The creation of a large number of synthetic fibres was one of the outstanding accomplishments of in-

dustrial research during the decade. New and unusual fabrics were produced from a variety of raw materials—from plastics, casein (milk), rubber and glass. New sources of textile fibres were discovered in redwood bark, asbestos, ramie (Boehemeria nivea) and other hitherto-unused natural materials.

Nylon, announced in 1938, became a preferred fibre for women's stockings, toothbrush bristles and numerous other products. The result of more than ten years of chemical research, nylon is synthetic polyamide derived basically from coal, water and air. Some 80,000,000 lbs. were used for military purposes during World War II, notably in parachutes, cord for aeroplane tires, glider tow and pick-up ropes, and rigging for barrage balloons.

New developments in rayon included a process, announced in 1942, for drawing rayon filaments to a diameter of only 0.0001 in. or one-eighth the weight of silk. Yarn, formed by twisting 160 such filaments, was available. Another new process, announced in 1942, produced spun rayon yarn by tow-to-top conversion of continuous filaments at one-fifth the cost of previous processes.

Noteworthy among the later protective treatments for textiles were the use of soluble aluminum acetates and several patented preparations as permanent water-repellents, ammonium sulphamate as a flameproofing agent, and sulfuryl chloride as a nonshrinking agent for all-wool blankets and socks. (See also Textile Industry.)

Wood Products.—Considerable progress was noted in developing antiseptic and preservative treatments for protecting wood products against discoloration, decay by fungi and bacteria, and attack by insects. Sap stain and mould on freshly-cut lumber were minimized by chlorinated phenol treatments. A method of protecting lumber against fungi and bacterial decay was developed, using a 5% solution of pentachlorphenol in light oil. This treatment was said to have provided protection against both decay and insect attack on wood specimens buried in moist soil for as long as ten years.

Improvements in plywood, made by bonding together thin laminations of wood and, in some cases, metal sheets, were greatly stimulated by the large wartime demand for these materials. Synthetic-resin bonded plywood virtually replaced the older animal and vegetable-glue bonded materials. Impregnated plywood is an unusually hard and durable material in which the bonding resin permeates the cells of the wood. Dielectric heating provided an improved means of obtaining high temperatures in the centre resin layers without damaging or overcuring the outer layers.

Among the many noteworthy developments in paper was the development of a satisfactory process for obtaining wood pulp from southern pine sapwood and the commercialization of a number of chemical treatments for providing superior strength and wetting resistance to paper.

Agriculture.—The spectacular increase in farm productivity which was made possible by the introduction of farm machinery during the 19th century was continued by the engineer and the chemist. The decade 1937–46, witnessed numerous improvements in agricultural mechanization, in the use of chemicals to promote crop growth and combat insect and weed pests, and in the scientific control of seed strains and soil conditions.

Noteworthy developments in agricultural machinery were stimulated by the steady transition of farm workers from agriculture to other industries. Equipment became available for the complete mechanization of the sugar beet industry; seed processors, precision planters, mechanical blockers and mechanical harvesters made possible an increase in productivity of nearly 200% in terms of the man-

hours required to produce a given crop. Similar progress was noted in the cotton industry. Mechanical cotton pickers capable of picking up to one bale per hour were in experimental use in California and the Mississippi delta region. The production of hay, one of the largest crops in the United States, was mechanized from start to finish.

Many of the most striking developments in agriculture during the decade resulted from the application of chemistry to farm problems. Soil fumigation, a means of combating root-attacking pests, was applied successfully in many areas. Mechanical cultivation was facilitated by coating or pelleting certain kinds of seeds, such as fine sugar beet seeds.

Herbicides, fungicides and insecticides received an increasing amount of attention. DDT (dichloro-diphenyltrichloroethane), which was used in enormous quantities during the war for mosquito control, was one of a large number of new insecticides available for insect control. Other chemicals, such as 2,4-D (2,4-dichlorophenoxyacetic acid), were used as selective weed killers. Treatment with 2,4-D was effective in eradicating broad-leaf lawn weeds such as plantain, buckhorn, ground ivy, chicory and dandelion. Ammonium sulphamate was found to be effective against poison ivy and many other noxious weeds. (See also Agriculture; Chemurgy; Entomology.)

Food.—The co-operative work of the chemist, chemical engineer, bacteriologist and biologist resulted in noteworthy contributions to the packing house industry. The nutritive value of many foods was enhanced by improved preservative treatments and by vitamin and protein enrichment; dehydration and quick-freezing made possible greater stability of perishable food-stuffs in storage and reduced weight and bulk in shipment; pharmaceuticals and other valuable by-products were obtained from food materials formerly classed as waste products.

Difficulties with freezing, caused by massive ice crystals which rupture delicate cells, were overcome by the introduction of quick-freezing methods. In this process, freezing is accomplished very rapidly so that the ice crystals are intercellular; on thawing the water is reabsorbed by the cell material. Fish, meat, poultry, fruits and vegetables became regularly available in quick-frozen form. Frozen cooked foods, such as pork and beans, spaghetti with tomato sauce, and corned beef hash, were a new development.

Dried foods, such as powdered milk and eggs, had been staple commodities for many years. Methods were developed during the decade to control dehydration so as to make it applicable to a large number of food products. Many, but not all, varieties of fruits and vegetables could be satisfactorily dehydrated. In general, the fruit or vegetable is peeled, then cut or shredded to preferred size. Chemical treatment or blanching is usually required to halt enzyme action so as to preserve vitamin content and retard discoloration. The prepared fruit or vegetable is then spread on trays and dried by countercurrents of air at about 140°F.

Considerable progress was noted in utilizing many valuable hormones and biochemical catalysts derived from the glands of slaughtered animals. Growth, gonadotroptic and lactogenic factors were separated in concentrated form from the anterior lobe of the pituitary. Insulin and trypsin from the pancreas and pepsin from the gastric mucosa were prepared in pure crystal form. Vitamin C was extracted from suprarenals, which, formerly waste, became a potentially important part of the slaughtering industry.

Famine conditions in many sections of the world during and immediately after World War II focused attention on the need for large scale methods of producing emergency proteins. Yeast, alfalfa and other grass roots, cat tail rush (Typha), and seaweed were investigated as possible sources of large tonnage emergency foods. Considerable research was devoted to the harvesting and processing of plankton, microscopic organisms in ocean surface waters this was apparently the largest unused source of food available for men and animals (See also Dietetics)

Pharmaceutical Research.—The achievements of industrial research in the pharmaceutical field particularly in chemotherapy, were truly epoch making sulfa drugs, penicillin, synthetic antimalarials and many other new compounds of therapeutic value were either discovered or brought to large scale clinical usefulness during the decade 1937–46 Equally impressive progress was noted in the synthesis of vitamins, in the extraction of hormones and other glandular derivatives, and in the processing of blood plasma.

The revival of interest in chemotherapy stemmed from the discovery that sulfanilamide, announced in 1935, is an effective antibacterial agent in the treatment of infections caused by streptococci, meningococci and gonococci Ef forts to develop a sulfa drug which would also be effective against pneumococci led to the discovery of sulfapyridine in 1938, followed by the less nauseating sulfathiazole in 1939, and the still less nauseating sulfadiazine in 1940. All three of these compounds are effective against streptococci and meningococci as well as pneumococci Sulfaguanidine, an nounced in 1940, differs from the other well known sulfa drugs in respect to its lower absorption in the intestinal tract and proved useful in treating intestinal infections such as bacıllary dysentery The mode of action of all sulfa compounds, of which there were some 2 000 under investigation at the end of the decade, appears to be bac teriostatic (rendering the bacteria vulnerable to white blood cell attack) rather than bactericidal

Although the antibacterial effect of the green mould Penicillium notatum had been announced by Alexander Fleming as early as 1929, it was not until 1940 that the tremendous therapeutic value of this substance was generally recognized Placed in production by several US pharma ceutical houses in 1941, penicillin rapidly grew to major importance as a treatment for infections caused by sta phylococci, pneumococci, streptococci gonococci and meningococci Penicillin is a complex mixture of several active principles, two of these, penicillins F and G, were isolated in 1943, a third, penicillin X was isolated in 1944, and a fourth, penicillin K, in 1945 Research at the end of the decade was directed toward obtaining improved yields from mould cultures, studying methods of synthesizing the active principles, and investigating the antibacterial possi bilities of some of the 100,000 other known moulds and fung: One of the most promising of the newer mould antibacterials was streptomycin, under active investigation at the decade's end

The emergency created by the Japanese conquest of the cinchona plantations of Bandang, Java, acted as a tre mendous impetus to the long pursued search for synthetic cinchona alkaloids and other antimalarials. Starting with two known substitutes for quinine, plasmochin for the treatment of fulciparum malaria and atabrine (or quinacrine) for the treatment of vivax malaria, the pharmaceutical industry, in co operation with university investigators and under the direction of the Office of Scientific Research

and Development undertook a large scale wartime antimalarial research program involving the synthesis and investigation of more than 14 000 compounds. Some of the practical results of this tremendous program were the development of improved production processes and clinical techniques for atabrine, the discovery of a number of new antimalarials, notably several members of the 4 aminoquinoline series, and the exploration of the 8 aminoquinoline series as a possible source of nontoxic curative agents. Although OSRD sponsorship terminated at the end of the war, the antimalarial research program was actively continued by a number of pharmaceutical houses.

The success of biochemists in isolating and synthesizing vitamins was particularly noteworthy. During the decade the existence of vitamin B₀ was established, vitamins B₀. E, and G were isolated, and vitamins A, B₁, B₀, and K were successfully synthesized. Vitamin B₀ the antiacro dynia factor, was discovered in 1936, isolated in pure form in 1938, and synthesized as pyriodoxin in 1939. Vitamin E, established in 1922 as an antisterility factor was identified as alpha tocopherol in 1936 and synthesized in 1938 beta tocopherol, gamma tocopherol and alpha tocoquinone were also found to possess vitamin E potency. Nicotinic acid amide, synthesized by oxidizing nicotine as early as 1867, was shown to be the active principle of vitamin G, the antipellagra factor, in 1937.

Interest in plasma transfusion for treating traumatic shock caused by wounds or burns was greatly stimulated by World War II While direct transfusion of whole blood was practised on a limited scale during World War I, it was not until 1932, when it was discovered that blood could be preserved for six hours or more by refrigeration that the practical development of transfusion became pos sible During the decade 1937-46, interest centred largely on plasma, the supernatant fluid component of blood which unlike whole blood can be stored in frozen form for as long as five years. In addition, plasma need not be donor typed, does not add to haemoconcentration is freer from reactions than whole blood, and may be adminis tered in larger quantities or in concentrated form if de sired A satisfactory method of packaging dried plasma so as to make it available for immediate use under combat conditions, was developed during World War II Dried plasma, which can be reconstituted by the addition of dis tilled water, may be stored indefinitely. At the end of the decade, research was concentrated on investigating the properties and uses of pure plasma proteins (See also Bio CHEMISTRY, CHEMOTHERAPY, MEDICINE, VITAMINS)

Infantile Paralysis

Infantile paralysis (poliomyelitis) is an infectious communicable disease caused by a specific virus. The patient with the malady may or may not manifest paralysis of muscles, and, in addition, some evidence appeared during the decade 1937–46 to indicate that certain individuals may harbour the virus without showing any recognizable symptoms of the disease. Infantile paralysis has occurred throughout the world, but severe epidemics of the disease are more common in the temperate zones where they usually occur during the late summer. That cases of

infantile paralysis occur throughout the year, even during the winter months, was confirmed by recovery of the virus from patients with the disease.

Diagnosis.—The early symptoms of infantile paralysis are similar to those of the contagious diseases common to childhood, viz., fever, headache, nausea and vomiting. Frequently the patient is quite restless and exhibits a marked apprehension. Later on there may be present muscle "spasm," weakness and pain—the latter especially on motion. Muscle "spasm" is an abnormal tenseness, firmness or hardness of muscles believed by many to be peculiar to infantile paralysis. Still later flaccid paralysis may be present, although it became known that paralysis is by no means a constant accompaniment of the disease.

Since a specific laboratory test had not been developed by the end of 1946, a diagnosis of infantile paralysis had to depend on the array of clinical symptoms and signs, together with certain laboratory procedures to rule out other virus diseases. The diagnosis could be strengthened materially by recovery of the virus from the patient's throat or bowel. However, this test was not practical for an ordinary diagnostic laboratory because it was very expensive and time-consuming, and especially because the interpretation of results required considerable technical skill and experience.

Pathology.-It was believed originally that the virus of infantile paralysis invades the brain and spinal cord only in the paralytic form of the disease. A number of experimental studies during the decade 1937-46, however, indicated that the virus probably invades the central nervous tissues in both the paralytic and the nonparalytic forms of the malady. The essential difference between the two forms of the disease is that in the latter an equilibrium, the mechanism of which was unknown by 1946, is soon established between the virus and the central nervous tissues of the host. This equilibrium limits virus invasion rather abruptly, with little damage to nerve cells; or perhaps the virus is induced to follow pathways that are so scattered as to leave undamaged, in any one area of the brain or spinal cord, sufficient numbers of nerve cells to carry out normal activity.

It was formerly believed that the pathology of infantile paralysis was destruction of the large motor (anterior horn) cells of the spinal cord only. Studies during the decade indicated that, whereas the virus does have a particular affinity for these cells and that destruction of these cells is responsible ultimately for the disability characteristic of the disease, other nerve cells in the brain, spinal cord and peripheral ganglia are also susceptible and that the symptomatology of the disease cannot be explained adequately on the basis of damage to the large motor cells alone. It was shown experimentally in monkeys that muscle "spasm" may be evident in the extremities at a time prior to the appearance of virus in the spinal cord. Some investigators thought that nerve cell damage was secondary to alterations in the blood vessels and in the intercellular fluids of the brain and spinal cord. By 1946, however, after the experimental disease had been studied in monkeys and in chimpanzees, it was generally believed that the virus acts directly upon the nerve cell. Several investigators reported that the virus of poliomyelitis interferes with the metabolism of glucose by the nervous tissues. This observation, if shown to be true by continuing experimentation, might be interpreted to indicate that the virus destroys the nerve cell by interfering with its source of energy.

The Virus.—The virus which causes infantile paralysis is so small that it readily passes through the finest filters—filters which easily hold back the smallest bacteria. By

1946, the virus particle had not yet been identified with certainty by means of the electron microscope.

In patients with the disease, the virus can be recovered most readily from the stools and from the secretions of the throat. It has been recovered from the throat only early in the disease, usually for a week at most, and with much less frequency than from the stools, from which it has been recovered for six or eight weeks and even longer.

Experimental studies showed that the quantity of the virus in the brain and spinal cord is highest on the day of paralysis and is somewhat less on the preceding and following days. The quantity diminishes rapidly after onset of paralysis, and the virus tends to disappear from the brain and spinal cord by the second week.

Several different strains of the virus of infantile paralysis had been isolated by 1946. Although each strain is capable of producing the disease, they differ from one another in degree of virulence, in their capacities to invade the brain and spinal cord after they are injected into various parts of the body, in their abilities to induce the disease in different experimental animals, and in their abilities to stimulate the formation of antibodies which are found in the blood and which are capable of inactivating the virus.

Relatively little was known in 1946 regarding the physical and chemical structure of the virus particle. Laboratory methods by which the virus could be concentrated and purified were necessary. One development, the ultracentrifuge, enabled investigators to concentrate and remove most, if not all, of the virus from the various materials in which it is found. However, methods had not yet been found by which the virus could be purified completely.

Investigators had long been handicapped by their failure to obtain multiplication of the virus except in living nerve cells. One of the most intriguing developments was the possibility that the virus may grow in embryonated eggs. If the results of these preliminary studies were borne out by further investigations, workers would have a method whereby large quantities of the virus could be produced cheaply and with much less effort. More important, this procedure would make it possible for investigators to study in a relatively simple and easily controllable medium the various agents (drugs and serums) which might influence multiplication of the virus.

Portal of Entry.—The experimental disease can be induced most readily in a susceptible laboratory animal (chimpanzee, monkey, cotton rat or Swiss mouse) by injecting the virus directly into the brain. It may also, under certain conditions, be induced by dropping the virus into the nostrils, by feeding, by injecting the virus into or beneath the skin, etc. Infection by these latter methods, however, is less certain and apparently is dependent upon the species of animal and upon the strain of virus employed. The upper respiratory and alimentary tracts were cited as the most likely points of entrance for the virus in man.

Formerly, most investigators had believed that in man the nose was the most important portal of entry for the virus. The following observations were cited in support of this concept: (1) infection could easily be induced in the monkey by dropping the virus into the nostrils; (2) following instillation of the virus into the nose, the virus was found in the olfactory bulbs before it was found in other portions of the brain; (3) the virus was recovered from the naso-pharynx of human beings suffering from the disease; (4) infection could not be induced by dropping virus into the nostrils of monkeys if their olfactory tracts had previ-

ously been cut or it then olfactory mucous membranes had been "blocked" by the use of certain chemicals, and (5) induction of the experimental disease in the commonly employed Macacus rhesus monkey was found to be exceedingly difficult if the virus was administered by any normal route other than the nasal.

The results of many investigations, however, led the majority of investigators to believe that in man the virus of infantile paralysis more commonly invades the brain and spinal cord by way of the upper part (mouth and pharynx) of the alimentary tract. This change in point of view resulted from the following observations: (1) the virus had been recovered from the stools of patients and contacts, particularly those under eight years of age (in one such case the virus was recovered from the stools 19 days prior to the onset of the disease); (2) the virus, or lesions believed to be caused by the virus, had been found in the ganglia of certain nerves which connect the brain and spinal cord with various parts of the alimentary tract; whereas the virus, or lesions believed to be caused by the virus, had only rarely been found in the olfactory bulbs of fatal cases of the disease in man; (3) it had been shown that chimpanzees, and also certain species of monkeys, contract the disease if the virus is administered by mouth, and that cutting of the olfactory tracts prior to feeding the virus did not prevent the disease; and (4) it had been shown that removal of the tonsils and adenoids increases susceptibility to infantile paralysis; of especial importance was the finding that when the disease strikes such individuals there is an increased tendency to develop the bulbar form. Some histopathological evidence was presented strongly suggesting that in man the virus may very commonly invade the body through the mucous membranes of the mouth and throat and subsequently gain entrance to the brain by way of certain of the cranial nerves.

Factors Affecting Resistance.—As in the case of other contagious diseases, three kinds of resistance, viz., natural, actively acquired and passively acquired, are recognized in infantile paralysis.

Natural resistance does not depend upon previous contact with the virus. In infantile paralysis this type of resistance appears to be dependent upon such factors as species, sex, heredity, nutrition and the physiological state of the host.

It was shown during the decade that mice exhibit an increased resistance to the virus of infantile paralysis if they have previously been fed a diet deficient in certain vitamins, particularly vitamin B₁ (thiamin), or a diet deficient in calories alone. It was difficult to relate these findings to man because experimental studies on cotton rats and monkeys had failed to reveal a similar relationship.

That metabolic alterations of the nerve cell could alter markedly its susceptibility to the virus was evidenced by the observations of Howard A. Howe and David Bodian. These investigators cut the processes of the nerve cells in the spinal cord which supply the muscles of the lower extremity. It was found that these cells were always susceptible to the effects of the virus of infantile paralysis except during the period when they were regenerating their severed processes. This observation was of particular importance because it was easy to reproduce in these cells the metabolic state which enables them to resist the virus. Now, for the first time, it was possible to begin detailed physiological and chemical studies designed to bring forth the exact mechanism by which nerve cells could be made to resist the virus.

Actively acquired resistance is that which results from: (1) an attack of the disease or (2) the injection of vaccines.

It was formerly believed that one attack of the disease resulted in life-long immunity to subsequent attacks. However, a number of reports during the decade 1937-46 indicated that this was not necessarily true. Many investigators came to believe that experimental animals or man may sustain second and even third attacks of the disease if the central nervous tissues are attacked by a strain of the virus different from that causing the first attack, or if the same or different strains of the virus can reach susceptible nerve cells which had not previously been in contact with the virus. With regard to this latter possibility, Thomas M. Rivers pointed out that "... it is possible that the so-called actively acquired immunity to infantile paralysis is due to the fact that most, if not all, of the susceptible cells at the usual portal of entry of the virus are destroyed during one frank attack of the disease, none being left to support the activity of virus coming that way later. However, if the virus should use a portal of entry different from that employed in the first attack, a second attack might occur." (Thomas M. Rivers, "Immunological and Serological Phenomena in Poliomyelitis," in Infantile Paralysis: A Symposium, New York, National Foundation for Infantile Paralysis, Inc., 1941, pp. 57-82.)

A great many attempts were made during the decade to develop a vaccine against infantile paralysis. The story of this work was filled with tragedy and disappointment. No vaccine was developed for man which was both safe and effective. Late in the decade, two investigators prepared a vaccine by the ultraviolet light method, which was remarkably effective in mice. Whether this vaccine could ever be used to prevent the disease in man was still problematic.

It had been known for some time that human beings and monkeys convalescent from an attack of infantile paralysis may develop in their blood antibodies which are able to neutralize the virus. It was only natural to believe that injections of immune serum or the globulin fraction of immune serum (passively acquired resistance) might enable an individual to resist infection with the virus, or that such injections might even be effective in the treatment of a frank attack of the disease. Up to the end of the decade, however, evidence of such protection, as judged by the results of carefully controlled clinical trials, had failed to support this hypothesis.

Possibly undue fatigue, excessive exercise and sudden chilling would not alter susceptibility to the virus, but there was some evidence to indicate that, if the virus is already present within the body, these stresses may provoke the more serious forms of the disease in an individual who might otherwise escape paralysis.

Transmission of the Virus.—The exact mechanism by which infantile paralysis is spread also remained unknown in 1946. It was recognized that the virus is widespread in nature. However, it would appear that the largest and most constant reservoir of the virus is man himself. The virus had been isolated from domestic sewage upon several occasions, especially the sewage from localities in which cases of the disease were occurring. It had also been isolated from pools of flies captured in the vicinity of cases of the disease.

For a time it was believed by many investigators that the common housefly played an important role in the spread of the disease. This concept was supported by the results of one experiment in which the disease was produced in chimpanzees by feeding these animals foods which had been freely exposed to flies in the home of a patient with

Sister Kenny, Australian inventor of the famed treatment for infantile paralysis, went to the U.S. in 1940 to teach her method to U.S. doctors and nurses. Here she is shown at a demonstration in 1942 exercising a victim's limb to restore muscular activity

the disease. While it was undoubtedly true that the fly may play a part in the mechanical conveyance of virus from faecal material to food, the weight of evidence indicated that the disease most often is transmitted by intimate contact between a susceptible person and a "healthy carrier" of the virus or a patient with the disease. Although the nature of this contact was not clear, contamination by the excretions of the bowel and/or the secretions of the pharynx were strong possibilities.

That this problem had not been solved was due in most part to the failure to develop a more sensitive test for the virus. The only such test available, i.e., inoculation of suspected material into the brain of the monkey, was of importance only when a positive result was obtained. It was

generally agreed that this test was unreliable for detecting small quantities of the virus; and a test sensitive to these small quantities was required to solve the problem.

Treatment.—While no drug, serum or vaccine had been found to be effective, the decade 1937–46 witnessed a revision in the treatment of patients with infantile paralysis. Formerly treatment during the late acute and early convalescent periods stressed rest and the use of those procedures (splints and casts) which were designed to maintain the affected parts of the body at rest in their normal position.

Infantile paralysis is a disease which affects muscles secondarily by interrupting their nerve supply. When a muscle is deprived of its nerve, the muscle progressively wastes away until finally it is no longer able to function even if its nerve subsequently becomes re-established. The maintenance of muscles in good condition thus assumed primary importance in the modern treatment of infantile paralysis.

At the end of the decade 1937-46, treatment was as follows: The patient was hospitalized as soon as possible and applications of moist heat were begun immediately to all parts of the body showing evidence of muscle "spasm," tenderness and pain. These applications were continued until such time as muscle "spasm", and pain had disappeared. All affected parts were subjected regularly to passive motion within the limits which could be tolerated without pain. Upon the disappearance of pain the patient was encouraged to exercise the affected parts regularlycare being taken to prevent fatigue and to insure that movements were performed by the appropriate muscles acting in proper co-ordination. This treatment resulted in improvement in the condition of the muscles. Experimental studies in progress on the effects of massage, electrical stimulation and the oscillating bed, offered considerable hope that the rate of recovery would be increased, that the mechanical handicaps resulting from contractures and muscle imbalances would be further minimized and that re-establishment of useful function would be greatly facilitated.

The decade witnessed real improvement in surgical procedures applicable to infantile paralysis. One of the more crippling of the aftereffects of this disease had been a result of unequal growth of the lower extremities. Procedures were devised to correct this condition, but until late in the decade full correction was seldom obtained because it was impossible to predict accurately the extent to which the two limbs would grow. As a result of a long-term study a prediction chart was developed which enabled the surgeon to perform the operation at such a time that full correction was usually obtained.

Of special interest to both the scientist and the victim of the disease was the creation of The National Foundation for Infantile Paralysis. This organization not only supplied the money to enable scientists to continue their efforts to eradicate the disease, but also enabled every victim of the disease—regardless of race, creed or colour—to obtain the best available medical and hospital care.

(H. M. Wr.)

The Kenny Treatment.—In 1940 Sister Elizabeth Kenny travelled to the United States, bringing with her a technique for the treatment of early poliomyelitis which she had developed in Australia. Previous criticisms of her method both in Australia and Great Britain had been unfavourable. The Kenny method involved the detection of spasm in affected muscles and the application of heat through a technique including the application of woollen

cloths steeped in hot water. This, in turn, was followed by gradual re-education of the affected tissues. Previous to the adoption of this technique, orthopaedic surgeons had almost routinely recommended early splinting of affected muscles with a view to holding them in the most suitable positions so as to prevent permanent deformities and disabilities. In presenting her concept, Sister Elizabeth Kenny called attention particularly to the presence of muscle spasm and to mental alienation which had to do with the inability of the mind to stimulate action of the muscles through the nerve cells and finally, inco-ordination, which means that because of disturbances in the normal motor patterns, new motor patterns are developed which must function properly before normal action can occur.

The method was widely adopted and used on many hundreds of cases. Difficulties in determining the extent of paralysis made it difficult also to evaluate the results of various methods of treatment. Most studies seemed to justify the conclusion that spasticity of the muscles exists in infantile paralysis not only in the affected muscles but also in the antagonistic muscles, and that application of the Kenny method of treatment diminishes the pain and apprehension and relieves the spasm. This permits muscle re-education to begin within a few days or weeks. The method cannot, however, be considered a cure of the disease since the damage done to the nerve cells by the virus and the ability of the nerve cell to recover are the measure of ultimate cure rather than relief of the symptoms in the early stages of the disease.

Permanent paralysis is not prevented in the presence of destruction of the cells in the spinal cord.

The evangelistic personality of Miss Kenny, the fact that she was not a physician and was unwilling to accept medical criticism based on scientific data, raised a controversy and brought to her support many persons who aided in the establishment of a Kenny foundation with headquarters in Minneapolis and with a fund-raising campaign continuously carried on throughout the United States. Furthermore, a motion picture dramatization of her life and work was prepared by one of the leading motion picture companies. Infant Mortality

Comparisons of mortality in early life are generally based upon infant mortality rates computed by dividing the number of deaths within the first year of life during a calendar year or period by the number of live births within that year or period. Thus, there were 111,127 deaths under one year of age in the United States during 1944 and 2,794,800 births, so that the infant mortality rate was 39.8 per 1,000 live births.

International Comparisons.—There were wide variations in the infant mortality rates in the countries for which data were available. The most favourable rates were generally experienced by the English-speaking countries and the Scandinavian countries, while the highest rates were found in eastern Europe, Asia and South America. In addition, countries for which data were not available undoubtedly had poor records.

Infant mortality in the United States improved markedly after 1937, when the rate was 54 per 1,000 live births. From this point, the figure fell to 40 in 1942, a level which was maintained for the next two years. A further improvement, to 38, was experienced in 1945, and a provisional record for the first four months of 1946 showed a 31/2% decrease from the rate for the corresponding period of the year before. The beneficial effects of advances in medical science, improvement in sanitation and advances in standard of living undoubtedly were factors in this decline. There were, further, two specific factors toward improvement introduced within this period. First, the Social Security act of 1935 encouraged the individual states to develop and expand maternity centres in their less densely populated areas. Second, funds were made available by the federal government in 1943 to provide medical, hospital and nursing care for the wives and babies of men in the lower ranks of the armed services.

Infant mortality in Canada declined sharply within four years from 76 per 1,000 live births in 1937 to 56 in 1940; after a slight setback in 1941, the rate fell to 54 in the next two years. England and Wales had a record of improving infant mortality which reached a low of 50 per 1,000 live births in 1939, when war began. The disruption of normal civilian life by the war was undoubtedly the principal factor in the rapid rise in infant mortality for that country to a point of 60 per 1,000 live births in 1941. However, as civilian living conditions during the war became stabilized, the rate fell rapidly to 46 per 1,000 in 1944. Scotland, with higher rates than England and Wales, practically duplicated the experience of that country in regard to trend. Except for one year, New Zealand had the remarkably low infant mortality rate of about 30 per 1,000 live births from 1937 through 1944. The record for Australia remained at a little under 40 per 1,000 from 1937 through 1942, but improved rapidly in the next two years, reaching the low figure of 31 per 1,006 in 1944. The white population of the Union of South Africa experienced a low infant mortality of 42 per 1,000 live births in 1944, after a six-year period during which the rate hovered about 50 per 1,000.

A study of the health of children of occupied Europe

(International Labour Office, Montreal, 1943) described. from information then available, the conditions which led to increases in infant mortality in the countries affected. Although the food rations stipulated for expectant mothers and very young children were larger than those for the rest of the population, the allowances prescribed were usually below the standards set for good health, and it was generally difficult to obtain even the amounts allowed. There was also a tendency to reduce the rations as food became scarce. Moreover, the quality of the obtainable food deteriorated. The decline in living conditions also weakened the resistance of the body to disease. Some of the consequences of these situations were shown in the infant mortality rates for several of the countries involved. Thus, France in the prewar period 1937-39 had an average annual infant mortality rate of 65 per 1,000 live births; this jumped to 91 in 1940, the year the country was overrun. The rate then fell to 71 in 1942, but the next two years saw sizable increases. For Belgium, the 1937-39 average infant mortality rate was 75 per 1,000 live births, but 1940 and 1941 saw rates of 85 and 84 respectively; however, lower rates were reported for the next three years. The Netherlands had an average annual rate of only 36 per 1,000 in 1937-39; in the ensuing war years from 1940 to 1943, the rates were 39, 43, 40 and 40 respectively. The available record for Norway showed an increase in infant mortality from 37 per 1,000 live births in 1939 to 43 in 1941, but the rate returned to 37 in 1942.

Germany had an infant mortality rate of 60 per 1,000 live births in 1938 and 1939; this rose to 63 in 1940 and 1941 and then to 66 in 1942. The experience of that country undoubtedly worsened as the war continued. Infant mortality in Italy rose from 96 per 1,000 live births in 1939

to 115 in 1941, but the next year saw some improvement. The records for infant mortality in Bulgaria, Hungary and Rumania, always at a high level, continued high during the war years, although wide fluctuations were experienced.

No single pattern was discernible in the trend of infant mortality among the neutral countries in World War II. Thus, Switzerland maintained its rate at about 40 per 1,000 live births from 1941 through 1944, a level somewhat below that of the immediate prewar years. Sweden had a record of improvement—from 45 per 1,000 live births in 1937 to a level of about 30 for 1942–44. On the other hand, the recorded rate for Spain fluctuated widely; a figure of 143 per 1,000 live births was given for 1941, but this was reduced to 99 in 1943. Portugal likewise had high and widely fluctuating infant mortality rates.

Of the countries for which data are shown in Table I, Chile had consistently higher rates than any other country, although the trend was distinctly downward from 241 per 1,000 live births in 1937 to 181 in 1944.

Infant Mortality According to Age, Race and Sex.—Data for the United States in regard to these characteristics are shown in Table II. Mortality within the first year of life diminishes rapidly as the child grows older. Thus, in 1943, there were 29.9 deaths within the first three months of life per 1,000 live births. This decreased rapidly to only 5.0 per 1,000 live births at ages 3 to 5 months, then to 3.2 per 1,000 at ages 6 to 8 months, and finally to a low of 1.9 per 1,000 live births at ages 9 to 11 months. The distribution of total deaths within the first year of life, according to age, was: 28.7% of all first year deaths within the first day of life; 49.4% during the first week; and 61.3% during the first month.

Table II.—Deaths at Specified Ages Under One Year per 1,000 Live Births and Deaths Under One Year per 1,000 Live Births by Race and Sex,
United States, 1937 to 1944

The least improvement, after 1937, was in the death rate for the first few days of life, and the greatest improvement was in the rate for infants nearly a year old. Thus, in 1937, there were 14.7 deaths in the first day of life per 1,000 live births; by 1943 the rate had decreased to 11.6, an improvement of 21%. On the other hand, at ages 9 to 11 months, the rate was 3.4 per 1,000 live births in 1937 and 1.9 in 1943, an improvement of 44%.

Infant mortality rates in the United States were appreciably lower for white lives than for Negro lives, and lower for females than for males. For example, in 1944, white females had an infant mortality rate of 32.4 per 1,000 live births, as compared with 41.2 for white males; the corresponding figures for Negro infants were 55.0 for females and 65.5 for males. The rate of improvement in the infant mortality rates from 1937 to 1944 was about the same for each colour and sex group, the figures at the end of the series for each category being somewhat less than three-quarters of the corresponding figure at the beginning of the series

Cause of Death.—Nine causes of death accounted in 1943 for almost four-fifths of all deaths within the first year of life. These nine causes are: premature birth, congenital malformations, pneumonia, injury at birth, diarrhoea and enteritis, congenital debility, influenza, whooping cough and syphilis. Within the first day of life, the outstanding causes of death were premature birth and injury at birth, the two alone accounting for three-fourths of all such early deaths. On the other hand, toward the end of the first year of life, the respiratory and the digestive diseases became of major importance as causes of death. For example, at ages 9 to 11 months, pneumonia accounted for more than one-quarter of all deaths at these ages and diarrhoea and enteritis for about one-sixth of the total.

Each of the more important causes of death in the first year of life, except for congenital malformations, shared in the general decline in the infant mortality rate in the United States from 1937 to 1944. The improvement in the rate for premature birth-the most important cause of infant death-from 15.3 per 1,000 live births in 1937 to 11.9 in 1944, was very noteworthy. Factors in this gain were probably the advances in prenatal care for mothers and the increasing tendency toward hospital confinement. The rapid downward trend in the rate for congenital debility, from 1.6 per 1,000 live births in 1937 to only 0.9 in 1944, may also have been a reflection of better prenatal care for mothers. The infant mortality rate from injury at birth declined from 4.4 per 1,000 live births in 1937 to 3.6 in 1944; the improvement here may also have resulted, in large part, from the rising proportion of hospital confinements and also from better obstetrical service. Pneumonia, as a cause of death in infancy, showed an almost spectacular improvement, the rate falling from 7.5 per 1,000 live births in 1937 to 4.8 in 1944; this favourable situation undoubtedly resulted from the use of chemotherapy in the disease. The sharp decrease in the infant mortality rate from diarrhoea and enteritis, from 5.3 per 1,000 live births in 1937 to 3.3 in 1944 may be attributed to better knowledge, on the part of mothers, of the nutritional requirements of children and to the general rise in standard of living, with an improvement in the quality of foods. Allowance being made for the usual tendency toward cyclical movements, the infant mortality rate from whooping cough decreased markedly. The rate for syphilis, the lowest on the list in Table III, was halved during the period of survey.

In a review of the factors bearing upon infant mortality, J. Yerushalmy (Annals of the American Academy of Political and Social Science, 237:134-141, Jan. 1945) drew attention to the lower infant mortality among babies born to mothers from 20 to 30 years of age than to those with younger or older mothers. Infant mortality rates were also found to be lowest for children who were second or third in order of birth.

There was also a suggestion of a familial tendency to stillbirths and high mortality in early infancy.

Stillbirths.—It was observed that the chance of stillbirth is also smallest among women 20 to 30 years of age who are having their second child (Statistical Bulletin of the Metropolitan Life Insurance company, Oct. 1943). There was a rapid increase in the rate of stillbirth as the age of the mother advanced, particularly so in the case of first births. Women with large families were also found to have a high rate of stillbirth. For the United States as a whole, the reported stillbirth rates per 1,000 live births in 1943 were: white, 24.2, Negro, 46.2.

Month of Birth.—An analysis of infant mortality according to month of birth by P. R. Eastman showed that the chances of survivorship to their first birthday anniversary were best for babies born in summer, also the season when most babies were born. The study was based on data for the United States covering the period 1935 to 1937 (American Journal of Public Health, 35:913-922, Sept. 1945). Among babies born during the summer months, mortality from conditions largely congenital in nature, such as stillbirth, premature birth, congenital debility, and congenital malformation, was at a minimum. This was taken to indicate that summer babies are constitutionally stronger against the hazards of early infancy than babies born in other seasons. But, in addition, the study indicated that the summer is the best time for a baby to be born. This conclusion was based upon the variation in mortality from environmental, aside from the congenital, causes according to month of birth; this also tended to have its low point for babies born during the summer.

Geographic Variation Within United States.-There were rather wide variations in infant mortality according to region throughout the United States, as may be seen in Table IV, which reflects the situation among white babies only. It will be noted that the rates were generally lowest in the Northern and Pacific coast states and highest in the southern and mountain states. For example, in 1944, the west north central states had a rate of only 32.9 infant deaths per 1,000 live births; this was followed closely by the Pacific coast states with a rate of 33.3, and then by the middle Atlantic states, the east north central states and the New England states, all with rates near 34 per 1,000. Between these relatively favourable records and the showings made by the areas with high rates, there was a wide gap, amounting to at least 6 points. Thus, the south Atlantic states had an infant mortality rate of 40.4 per 1,000 live births among its white babies in 1944. For the east south central states the rate was 42.1 and for the west south central it was 43.3 per 1,000 live births. The mountain states had a rate as high as 48.1 per 1,000, principally because of the poor situation among the large Mexican population in this area.

The differences in the infant mortality rates between the

geographic divisions were not as great in 1944 as they were in 1940. This reflected, of course, a faster rate of improvement in the areas where the rates were highest. In the brief period from 1940 to 1944, the rate fell by 24% in the west south central states, by 18% in the mountain states, and by about 16% in the south Atlantic and east south central states.

On the other hand, decreases of 10% to 12% were found in the remaining geographic divisions.

Although it was commonly believed that health conditions were better in rural sections than in urban communities, the contrary situation was found in a study of infant mortality in which both births and deaths were duly allocated to the regular place of residence of the mother. As shown in the lower tier of Table IV, the infant mortality rate for white babies in 1943 was lowest in cities of 100,000 or more, the figure being 33.2 per 1,000 live births. There was a steady upward progression in the rate as the size of the community decreased. Thus, cities of 25,000 to 100,000 had a rate of 38.6; communities of 10,000 to 25,000, a rate of 40.2; and towns of 2,500 to 10,000 a rate of 42.1. However, rural areas reported a rate of only 38.3 per 1,000 live births.

The better showing of the large cities could be attributed to the accessibility of maternity hospitals and facilities especially designed for the care of pregnant women and newborn children, to the ready presence of specialized physicians, and to the availability of nursing services. Ingersoll, Royal Eason

Ingersoll (1883-), U.S. naval officer, was born June 20, 1883, in Washington, D.C., the son of Rear Adm. Royal Rodney Ingersoll. After graduation from the Naval academy in 1905 he served on several U.S. warships. He joined the Asiatic fleet in 1913 and the office of naval operations in 1916; during World War I he received the navy cross for his services in organizing, developing and directing the communications office of the navy department. After that war he served as executive officer and commander of battleships and cruisers. In Dec. 1937 Ingersoll was sent on a secret presidential mission to London to discuss possible U.S.-British co-operation in the event of a war with Japan. Pres. Roosevelt nominated him rear admiral in 1938, jumping him over the heads of a dozen senior officers. On Dec. 20, 1941, as part of the shake-up of command following the Pearl Harbor attack, Secretary of Navy Knox appointed him commander of the Atlantic fleet to succeed Adm. Ernest J. King, who became commander in chief of the U.S. fleet. Under Ingersoll's command in 1942-43 the Atlantic fleet not only did extensive convoy

duty but also played an important part in the invasions of North Africa, Sicily and Italy. Ingersoll was promoted to the rank of full admiral in July 1942. In Nov. 1944 he was awarded the distinguished service medal and was named commander of the western sea frontier with the status of deputy chief of naval operations; his task was that of accelerating the flow of men and equipment across the Pacific from the United States. In Dec. 1945, he relinquished this command.

Inönü, Ismet

Inönü (Ismet Pasha) (1884-), Turkish statesman, was born in Smyrna (Izmir) on Sept. 24, 1884. He was educated at an artillery school in Constantinople and at the General Staff college; by 1926 he had risen to the rank of full general. During World War I, he saw action in Palestine against the British, and was Kemal Ataturk's chief of staff during the campaign against the Russians in eastern Turkey. When the Greeks invaded Turkey in 1921, Inönü again served as Ataturk's chief of staff. He defeated the Greeks twice at Inönü and took the name of the battlefield after Ataturk decreed that all Turks must have surnames. With the proclamation of the Turkish republic on Oct. 29, 1923, Ataturk became president and Inönü was made premier. Although Inönü approved Ataturk's radical measures to westernize Turkey, he himself was more conservative and disagreed frequently with his chief. Inönü resigned unexpectedly in 1937, but after Ataturk's death in 1938 he was unanimously chosen president by the Grand National assembly.

During the early part of World War II, Inönü carefully avoided offending either Germany or the U.S.S.R. In late 1943, however, he conferred with President Roosevelt and Prime Minister Churchill in Cairo, and on Dec. 7 the three leaders proclaimed the unity of Turkey with the United Nations. Thereafter, Inönü led Turkey steadily into the Allied camp, breaking diplomatic relations with Germany (Aug. 7, 1944) and Japan (Jan. 3, 1945), and finally declaring war on both axis nations (Feb. 23, 1945), thus earning a seat at the San Francisco conference of the United Nations.

674 Institutum Divi Thomae

The Institutum Divi Thomae, graduate school of science of the Athenaeum of Ohio, was founded in 1935 by the Most Reverend John T. McNicholas, archbishop of Cincinnati, with Dr. George Speri Sperti as co-founder and director, to foster fundamental scientific research and to afford intensive research training to a limited number of graduate students.

The first paper reporting research conducted at the institutum was published in 1937. The ten-year span from 1937 through 1946 therefore coincided with the first decade of active scientific publication at the institutum. During this period, more than 175 papers appeared from the institutum and its affiliated laboratories. The broad fields covered were those of physics and biophysics, chemistry and biochemistry, biology, experimental medicine, cancer and the relation of philosophy to science. Important developments occurred in the study of cellular growth and metabolism, wound healing, antibiotics, the mechanism of drug action and cancer. In the field of cancer the promising results in the treatment of certain types of skin tumours by the injection of tissue extracts were reported in 1946. During World War II the major research efforts of the institutum were directed toward war projects, including studies of antimalarial and antidysentery drugs, wound healing, agar and studies of aviation instruments. In addition several of the members were active in the organization of research for the War Production board. (E. S. C.)

Insurance

Life Insurance.—Through all the turbulent years of the decade 1937–46, the legal reserve life insurance companies of the United States and Canada maintained substantial progress. Insurance outstanding (excluding reinsurance) rose steadily from \$110,361,000,000 at the beginning of 1937 to \$180,000,000,000 at the end of 1946, an increase of more than 60%. It was estimated that this insurance was held by some 75,000,000 persons, about half the population of the United States and a third that of Canada. New insurance declined in the early years of the decade from the \$13,649,000,000 written in 1937, to \$12,074,000,000 in 1940. Thereafter new issue increased, reaching \$16,984,000,000 in 1945. In 1946 it was estimated that more than \$20,000,000,000,000 of new insurance was put on the books.

Assets held by U.S. and Canadian companies to guarantee the fulfilment of their obligations doubled in the 10-year period, from \$26,886,000,000 at the beginning of 1937, to more than \$50,000,000,000 at the end of 1946. In addition, policyholders and beneficiaries received more than \$27,500,000,000 in benefit payments during the intervening 10 years. Such payments increased each year through 1940, but decreased thereafter because of the drop in surrender value demand. After the war's end, surrender value payments increased again.

World War II had a much more pronounced effect on life insurance in other countries than it did in the United States and Canada. In Great Britain, France, the Netherlands and Switzerland, new business declined in 1939 and fell abruptly in 1940 to a level about half that of 1937. The same general experience was noted in the Scan-

dinavian countries, although, except in Norway, the drop in 1940 was not quite so pronounced. After 1940 new insurance increased in all these countries to or beyond the prewar levels. Data on business outstanding showed that the total was in general well maintained in most countries, with a minor dip in some in 1940 that was later recovered.

Apart from war deaths, mortality among policyholders in the United States and Canada decreased in nearly every one of the ten years under consideration, continuing a trend that began some years before. Even during the war years, total mortality remained below that of 1936. Nearly all causes of death shared in the decline. Spectacular improvements, by more than two-thirds, were made in this period in death rates from influenza, pneumonia and appendicitis, chiefly because of new methods of chemotherapy (q.v.). Despite fears that the war might occasion a setback in the fight against tuberculosis, the longtime downtrend in mortality from this disease was maintained. In 1945 such deaths were about a third below the 1936 rate. Fatalities from motor vehicle accidents declined after 1936, particularly during the war, when gasoline rationing was in effect. Unfortunately, the death rate from this cause rose immediately after the war, but it still remained below that of 1936.

War claims paid by U.S. companies were reported at \$313,000,000. Of this, \$200,000,000 was paid on battle deaths, \$80,000,000 for deaths from accidents and \$33,000,000 for deaths from disease suffered by policyholders in military service. In total, the war claims represented about 6.7% of all life insurance death benefits paid in the war years 1942-45. The extensive military medical facilities of World War II that saved the lives of so many men wounded in action also served to cut down the deaths from disease to a much smaller proportion of total military casualties than in any previous war. Deaths from nonbattle injuries, however, were a much higher proportion of the total than in World War I, because of the large part that the aeroplane and other motorized equipment played in the later conflict.

The favourable trend in mortality during this decade was far overshadowed in its effect on the cost of life insurance by the decline in the interest rate earned on life insurance company investments, so that such cost to policyholders increased. Many companies were forced to raise premium rates for new policies by adopting a lower interest assumption. Older participating policies were affected by the reduction in interest earnings through substantial cuts in dividends. Thus, low interest rates hurt life insurance policyholders just as they did others who relied on the income from savings.

For life insurance companies and other institutional investors the downtrend in interest rates began with real force in the early 1930s and continued steadily all through the decade. The net rate of interest obtained on the assets of all U.S. life insurance companies in 1945, without allowance for asset gains or losses, was 3.05%. This was an all-time low and contrasted with 3.7% in 1936 and more than 5% in 1930. These drastic declines reflected in part the general world-wide downtrend in the pure interest rate and in part the change in the composition of insurance company investments from a preponderance of higher-yielding mortgages and corporate securities to a predominance of lower-yielding U.S. government bonds.

As to investments, the outstanding characteristic of the decade was the heavy acquisition of U.S. government securities during the war period. Even in the early 1930s, such bonds were already playing an increasing role. In 1930 they had formed less than 2% of assets, but by the

end of 1936 they amounted to more than \$3,800,000,000, or 15% of all assets, a larger proportion than even at the peak of World War I financing. At Pearl Harbor the total had grown to \$6,600,000,000. By the end of 1945 the companies had increased their holdings to \$20,500,000,000, or more than 45% of all assets. On Aug. 31, 1946, the companies held nearly \$22,000,000,000 in U.S. government bonds with an additional \$1,000,000,000 in dominion of Canada government bonds. In Britain, the life insurance companies ended the war with about 45% of their assets in British government securities, while Canadian companies' holdings of dominion government bonds were about half of their Canadian assets.

After increasing during the first five years of the decade, the proportion of assets in private corporate bonds declined because of the curtailed flotation of private securities during the war. In the immediate postwar period there was a slight trend upward. Holdings of industrial and miscellaneous bonds nearly quadrupled from the end of 1936, to about \$2,500,000,000 on Aug. 31, 1946, while public utility bonds more than doubled to nearly \$5,500,000,000. Railroads increased only slightly over the decade, from \$2,700,000,000 to \$3,000,000,000. Stocks, mostly preferred or guaranteed, increased a bit faster, to more than \$1,000,-000,000 at the end of Aug. 1946. Holdings of state and local government securities of the United States grew during the late 1930s but dwindled rapidly when the companies sold them off at high prices after the federal revenue act of 1942 deprived life companies of the normal benefit of holding tax-exempt securities.

Continuing an earlier trend, the proportion of assets in mortgages declined throughout most of the decade, but especially during the war period because of the restrictions on construction. With revival of building in 1946 this type of investment showed signs of recovery. City mortgage holdings increased from \$4,200,000,000 at the end of 1936 to nearly \$6,000,000,000 at the end of Aug. 1946; farm mortgage portfolio decreased in the same period from just under \$1,000,000,000 to \$785,000,000.

Beginning in the early 1940s, about a dozen states established urban redevelopment corporation laws with the aim of encouraging by certain special concessions the flow of life insurance and other private funds into rehabilitation of slum areas by construction of modern large-scale housing. In 1938 New York state had enacted a law permitting-but without special concessions-any company domiciled in that state to own and operate large-scale housing up to 10% of its assets. Somewhat similar laws were enacted later in several other important insurance states, notably New Jersey, Connecticut and Massachusetts. Before World War II, one company had under way three very large projects of this nature, and after the end of the war other companies entered this field. The housing already constructed or under construction at the end of 1946 totalled nearly \$300,000,000.

In addition to housing, companies began to acquire certain other urban income-producing real estate for investment. This was a new field for eastern U.S. companies, as permitted by laws enacted in Connecticut, New Jersey and New York. The New York law, passed in 1946, permitted such investments up to 3% of assets.

A major problem to life insurance companies was the question of properly distributing the increased hazard of death created by war. Before World War II most companies in the United States and Canada, and to a lesser extent in Great Britain, issued policies without any restriction on the insurance coverage because of military service. The idea was that, if and when war occurred, all policy-

holders already insured at the time would have full coverage, and the cost of the increased mortality among those called upon to face the direct risks of war would be distributed among the whole body of policyholders as a part of the general burden of war. In new policies issued during a war, however, war risk provisions would be included to limit the company's liability for death caused by all or some of the war hazards. This was necessary because otherwise persons knowing that they were or would soon become subject to the dangers of war would hasten to purchase as much insurance at normal peacetime rates as they could buy, thereby imposing a disproportionate risk on the existing group of policyholders.

When World War II broke out, the war risk provision adopted for new insurance in Great Britain excluded the risk of all deaths arising from war, whether the insured was in military service or not. Full coverage for the excluded risks was granted in some cases on payment of extra premiums varying with the particular policyholder's hazard. Generally no coverage was granted against the risk of death in aviation activities or in the air forces.

In U.S. and Canadian companies the war risk provisions were considerably less restrictive. In the type of provision used by most companies, there was no restriction on civilians or on military personnel while they were stationed in the home countries, as the war risk for them was relatively remote. For civilians travelling outside the two countries the risk of death as a result of war was excluded. Death while in military service outside the two countries was not covered, nor was the risk of death in aviation activities either at home or abroad. Full coverage for the excluded hazards (except air service abroad) could be obtained in some companies on payment of an extra premium.

With the cessation of hostilities, practically all U.S. and Canadian companies discontinued the use of war clauses in new policies and rendered inoperative the war provision in existing policies. In Great Britain many companies continued to include war risk restrictions in their policies.

In the United States, servicemen could purchase up to \$10,000 of national service life insurance, which was entirely free of all restrictions. The cost of claims traceable to the war was borne by the government as were all the expenses of administration. The aggregate amount in force reached a peak of about \$125,000,000,000 near V-J day. After demobilization, many servicemen permitted their national service life insurance to lapse in spite of its favourable features, and in spite of urging by the Veterans' administration and by the life insurance companies that they retain it. At the end of Dec. 1946 insurance in force had declined to about \$34,250,000,000.

In 1939 and 1940, an investigation into the operations of U.S. life insurance companies was conducted by the Temporary National Economic committee set up by the U.S. congress to investigate "concentration of economic power." Its inquiries into life insurance companies were initially to be directed to their investment operations but later were extended to all phases of the business. The questioning at the hearings reflected a generally critical attitude toward the industry but, as a whole, the record brought forth attested to the sound management of the companies and their achievements in providing protection. The final conclusions of the TNEC on life insurance, rendered in March 1941, were mainly directed to the several states, suggesting that they improve their insurance regulatory facilities in a number of respects. Some minor federal regulations were recommended. It was also sug-

gested that the companies improve the operation of industrial insurance.

A significant legislative development in the United States was started in 1943, when the states began to enact, as part of a nation-wide program, new standard valuation and nonforfeiture laws. This legislation was the result of several years' study by a committee of the National Association of Insurance Commissioners and was recommended by that body as well as by many life insurance organizations. It provided for the use of modern mortality tables and new methods of determining minimum values for policy reserves and nonforfeiture benefits. The new nonforfeiture method produced guaranteed minimum values more closely related to the equities of policyholders at the time of default in premium payment than was the case under older statutes. At the close of the 1946 legislative sessions, 24 states had adopted the new legislation, to take effect for policies issued from Jan. 1, 1948. There were perhaps 11 other states where the proposed measures appeared acceptable under existing statutes.

Another important insurance development was a decision by the supreme court of the United States in June 1944, declaring in effect that insurance was commerce and, when conducted across state boundaries, was interstate commerce as regards such statutes as the federal Sherman Anti-Trust act. This ruling was in a sense a reversal of decisions going back 75 years that held insurance was not commerce for the purposes of the cases then before the court. In March 1945 congress enacted a law under which supervision and taxation of the insurance business by the individual states was continued. With some exceptions, the application to insurance of the federal antitrust and other related laws was suspended until Jan. 1, 1948, but such laws would be in effect thereafter to the extent that the business was not regulated by state laws. After this decision the validity of the tax laws of certain states which imposed on domestic companies either no tax or a lighter one than on out-of-state companies was challenged by litigation, but in June 1946 the supreme court upheld such a tax law of South Carolina as well as certain regulatory statutes of California. The court held, in effect, that the federal legislation of March 1945 supported the existing state system of regulation and taxation, including statutes such as the ones challenged. Accident and Health.—With a gain of approximately 250%, premiums of commercial accident and health companies increased from \$195,123,702 in 1937 to \$675,000,000 in 1946. Figures compiled at the end of 1945 showed there were approximately 8,640,000,000 individual policies in force, 6,090,000 providing weekly or monthly indemnity benefits for both accident and health, while 2,422,000 provided accident benefits only and 128,000 sickness only. At the same time 5,928,333 were covered under 23,059 master group contracts for average protection of \$17 a week. A study of claim complaints received by the Michigan and Illinois insurance departments in 1945 showed that there was only 1 complaint out of each 1,223 claims filed. Out of the 967 complaints filed in comparison to a total of 730,429 claims, only 175 were held justified by state insurance

officials. The possibility of further expansion of state insurance plans and the extension of social security to include disability protection led commercial companies to liberalize practices and to give pronounced attention to public needs and attitudes. (See also SOCIAL SECURITY.)

Great Britain .- Of all the heterogeneous types of insurance included in the accident and miscellaneous account of the British offices, the two largest were motor and workmen's compensation insurance. From the end of July 1942 until June 1945, all pleasure motoring ceased and, accentuated by a wartime discount of 20% on the insurance rates for private cars remaining fully insured, the premium income from motor insurance yielded pride of place to workmen's compensation insurance, which was assisted by wartime factors such as increased rates of wages, overtime payments and the generally increased industrial activity. Property owners and general third party liability, plate glass insurance, fidelity guarantees and the insurance of boilers and machinery added to the increased volume of accident business transacted during the period 1937-46. Income from burglary insurance was assisted by the immensely increased values at risk, but claims rose to a very high level. The increasing number of passengers using aircraft caused a greater demand for personal accident insurance.

Legislation continued to play an important part in the development of accident insurance. With the upswing in wages and the cost of living, there were successive increases in benefits under the Workmen's Compensation act, but the additional liability imposed was absorbed by most insurers without increase in premium. The government's social security scheme set a term to the existing basis of compensation for industrial injuries, and by the operation of the National Insurance (Industrial Injuries) act, 1946, workmen's compensation insurance in Great Britain would cease to be required. Claims at common law, both in industry and in connection with road accidents, increased in frequency, and the high awards made by the courts were reflected in insurance claims experience. After the inception of compulsory third-party motor insurance, there remained the problem of the uninsured motorist. This was solved by the insurance companies and Lloyd's underwriters voluntarily entering into an agreement with the ministry of transport to bridge the gap in the law by setting up a pool from which victims of uninsured motorists would be compensated.

Welson, Personal Accident, Disease and Sickness Insurance (in England) (1943).

Automobile.—In the early part of the decade, many companies tried out the Safe Driver Award plan which allowed a return premium on policies covering automobiles which were not involved in an accident during the policy term. The plan was dropped shortly after Pearl Harbor, and at that time rates were substantially lowered because of gasoline rationing and the curtailed use of cars. For the first time, a rate reduction was not based on actual experience but was a judgment discount based on the new conditions brought about by the war.

All during this period, companies continued to broaden their coverage and included such items as medical payments coverage and drive-other-cars coverage for the owner and spouse. The passing of Financial Responsibility laws in many states substantially increased the number of cars insured.

After V-J day, the accident frequency jumped tremendously. With the ever-increasing cost of claims, rates were increased rather substantially a few months after the war. Property damage and collision rates were sharply increased primarily because of the greatly increased cost of repairs and replacements. Here again, rates were not based on experience. For the first time, rates were increased twice within a 12-month period, but most companies continued to have an unprofitable experience on their automobile business. (For British motor insurance, see above under Accident and Health.)

Fire Insurance.—Table I shows U.S. premium receipts; these statistics were compiled to include those from marine as well as fire insurance. It was necessary to include the latter because separate statistics were not in all cases available, and the same method for presenting the premiums received and the losses paid should be followed in order that those seeking actual comparisons might rely on the presentation.

For the ten years in question, premium receipts were as in Table I.

1938	378,096,941	52,522,560	19,074,473	449,693,974
1939	366,356,039	54,130,766	19,330,410	439,817,215
1940	405,335,697	58,938,791	21,006,494	485,280,982
1941	471,874,540	70,511,750	25,763,807	568,150,097
1942	630,119,331	72,641,133	24,834,561	727,595,025
1943	507,320,335	70,038,818	21,823,682	599,182,835
1944	554,579,236	82,115,247	24,193,246	660,887,729
1945	625.283.318	95.656.248	27.725.143	748.664.709

The year 1937 was the first year in which the total premiums exceeded \$1,000,000,000. For the next two years, 1938 and 1939, there was a drop below the billion dollar mark, but in 1940 the premiums were \$1,129,000,000, and in 1945 they rose to \$1,555,000,000. The year 1941 was the first in which losses exceeded \$500,000,000, amounting to more than \$568,000,000. In 1945 the maximum was more than \$748,000,000.

In this ten-year period, the most outstanding event in fire insurance was a decision of the U.S. supreme court in Oct. 1943, in the case of *The United States, Appellant*, v. South-Eastern Underwriters Association, et al. This decision reversed the earlier decision of 75 years previous and decided that insurance was commerce and therefore subject to federal jurisdiction. Inasmuch as the business of insurance had grown up around the earlier decision and all legislation was practically based thereon, it was considered that the decision was so far-reaching that a breathing

spell should be granted the companies and the states until Jan. 1, 1948. At that time, if the states had passed laws in conformity with federal laws, the U.S. government would accept that condition, but if any state had not so placed itself in harmony, the U.S. government might intervene. (See also Fires and Fire Losses.)

War Damage.—War Damage corporation was created by Reconstruction Finance corporation (an agency of the government of the United States) by authority of sections 5d and 5g of the Reconstruction Finance Corporation act, as amended. Its charter was executed on Dec. 13, 1941, and filed on March 31, 1942. The corporation's capital of \$100,000,000 was subscribed by Reconstruction Finance corporation.

By an act of congress of March 27, 1942, the corporation was empowered to extend gratuitous protection to real and personal property in the United States and its territories and possessions, and to property in transit between points in those areas. Such free protection was limited to losses resulting from enemy attack after Dec. 6, 1941, and before July 1, 1942, and was made subject to the authorizations and limitations prescribed with respect to the reasonable protection directed to be extended by the corporation under policies of insurance. By the same act of congress, the corporation was authorized and directed to extend reasonable protection against loss or damage 1esulting from enemy attack, in consideration of premiums to be collected by the corporation, and Reconstruction Finance corporation was authorized to supply War Damage corporation with funds for such purpose in an amount not exceeding \$1,000,000,000.

War Damage corporation's general insurance program became effective on July 1, 1942, immediately upon termination of the free compensation authorized before that date. In order to use existing facilities and avoid creating a new governmental organization to handle the program in the field, War Damage corporation entered into agreements with 546 fire insurance companies to act as "fiduciary agents" for the corporation in the issuance and servicing of policies of insurance and the collection of premiums. Through these companies and their subagents, the corporation operated in about 1,450 established, policy-issuing offices. The agent or broker who submitted an application for insurance received a service fee of 5% of the premium, the minimum service fee being \$1 and the maximum \$1,000 per policy. The insurance company through which the application was submitted and the policy issued and serviced received an expense allowance equal to 31/2% of the premium, but not less than 50 cents or more than \$700 for each policy, subject to future adjustment on the basis of actual expenses of the issuing company in connection with business transacted for War Damage corporation. The 546 participating companies had an interest equal to 10% of any final net operating profit resulting from the general program, such interest, however, not to exceed \$20,000,000, and assumed liability for 10% of any final net operating loss, such liability, however, not to exceed \$20,-000,000. Premiums collected under the general program aggregated approximately \$244,800,000 to June 30, 1945, and it was estimated that \$114,000,000,000 of War Damage corporation insurance was in force on that date. Under this program, more than 8,700,000 policies and renewal

certificates were issued by the corporation. Annual premium rates were uniform throughout the United States and its territories, and averaged not far from 10 cents per \$100 of insurance, varying with different types of property. Investigation and adjustment of claims were conducted by the corporation through the offices and facilities of Fire Companies' Adjustment Bureau, Inc., Western Adjustment and Inspection company and Underwriters Adjusting company, which made their personnel and some 465 offices throughout the United States available to War Damage corporation for that purpose. Compensation for such services was made on a basis of actual cost.

On Dec. 21, 1942, insurance was made available on money and securities through 88 casualty and surety insurance companies which acted as fiduciary agents. The service fee and expense reimbursement allowed to brokers and participating companies were the same as under the general program, and the participating companies had a similar 10% interest in the operating profits or losses, such interests, however, not to exceed \$5,000,000. As of June 30,1945, premiums from the Money and Securities program aggregated approximately \$980,000, and approximately \$3,000,000,000,000 of insurance, covering money and securities, was in force under nearly 2,800 policies.

On March 15, 1943, the corporation entered into a contract of reinsurance covering widely-distributed plate glass insurance risks, receiving therefor a premium of \$146,793. No loss was suffered under such contract of reinsurance.

War Damage corporation did not at any time issue policies of insurance on vessels or cargoes at sea, and pursuant to the authority contained in the act of March 27, 1942, ships, antiques, works of art and other specified classes of property were, with the approval of the secretary of commerce, generally excluded from the protection authorized by the act.

Insurance which was duly in force on March 31, 1944, was automatically extended for 12 months without additional premium or other charge, and insurance in force on Feb. 28, 1945, was similarly extended. No renewal or extension of insurance was authorized by War Damage corporation in 1946, and insurance that was extended in 1945 terminated upon expiration of that extension.

Under its insurance programs the corporation suffered losses amounting to less than \$100,000, including that which resulted from the explosion of the destroyer "Turner" on Jan. 3, 1944.

Payments by the corporation on account of the free compensation authorized to be made for losses sustained after Dec. 6, 1941, and before July 1, 1942, aggregated \$370,418.04 on June 30, 1946. On Aug. 9, 1946, the corporation gave public notice that all claims for free compensation for loss of or damage to property in the territories or possessions of the United States (other than the Philippines) had to be presented before Oct. 16, 1946.

War Damage corporation having been authorized by the act of March 27, 1942, to receive and adjust losses suffered after Dec. 6, 1941, and before July 1, 1942, in the Philippine Islands, the corporation received, during the years from 1942 to 1946, several thousand claims for losses suffered in that area. In June 1945 War Damage corporation sent three special investigators to the Philippine Islands to make a general survey of war damage to property in that area. The survey was completed in Sept. 1945; the report made to War Damage corporation was published in a senate committee print of the 79th congress,

first session, for the use of the committee on territories and insular affairs.

On April 30, 1946, public law 370, 79th congress, created a new agency designated as Philippine War Damage commission, which was authorized to make compensation, to an extent specified in the act, for war damage to property in the Philippine Islands. By that act the previous authority of War Damage corporation to make compensation for loss of or damage to property in the Philippine Islands was terminated, and War Damage corporation was required to make available or deliver to Philippine War Damage commission all records, claims, files and other documents in its possession pertaining to Philippine claims. (G. E. A.)

Great Britain.—The War Risks Insurance act, 1939 (part 2), and the War Damage act, 1941, were the principal acts governing war damage on land in Great Britain and Northern Ireland. The former act was commonly known as "the commodities insurance scheme." Part 1 of the act of 1941 made provision with respect to war damage to buildings and immovable property, while part 2 of the act detailed further insurance schemes, i.e., "the business scheme" applying to business goods not insurable under the commodity scheme, and "the private chattels scheme," applying to household goods and personal effects, not being goods insurable under the business scheme.

Under the "commodities" and "business" schemes, insurance was compulsory where the total value exceeded £1,000, while under the "private chattels" scheme, limited free compensation was allowed with the option to effect additional cover by paying a premium and taking out an annual policy. Under these three insurance schemes the board of trade acted as insurer, while sources outside government departments such as fire insurance companies, Lloyd's brokers and others carrying on insurance agencies, were called into service in connection with the registration of cover, the collection of premiums and the issue of policies. The period of the policies varied from one month to a year and the total number of policies issued under the insurance schemes was: commodity, 9,500,000; business, 4,100,000 and private chattels, 3,900,000. In addition, more than 20,000,000 persons were entitled to free cover under the private chattels scheme.

Two government White Papers showed the financial position of the schemes at March 31, 1945, as follows:

	Premiums and Cother Receipts	Claims and Expenses £
Business scheme	77,000,000 16,000,000 203,000,000	93,000,000 87,000,000 122,000,000
	£296,000,000	£302,000,000

The work of the insurance interests on behalf of the board of trade was done at cost and without profit, and earned the high commendation of the government.

For the purpose of part 1 of the War Damage act dealing with buildings and immovable property, a War Damage commission was constituted, consisting of persons appointed by the treasury. Contributions were collected through the medium of the inland revenue authorities, and were compulsory in respect of all properties assessed for income tax under schedule A, or if included in a valuation list for local rates. A statement issued in Sept. 1945 by the War Damage commission estimated contributions to yield £200,000,000, to which the government had undertaken to add, if necessary, a like sum from the exchequer. At that time the commission had paid out £271,281,171 in respect of war damage cost, and the major part of its task had still to be dealt with. In addition to the cost of repair or

rebuilding some 3,000,000 properties, there were about 200,000 properties scheduled as total losses for which the commission would be called upon to make a value payment.

The War Damage act was amended in the light of experience by the War Damage (Amendment) acts of 1942 and 1943. Legislation to provide for compensation in respect of action taken in the exercise of certain emergency powers, such as the requisitioning of land or property, was set out in the Compensation (Defense) act, 1939.

Marine.—As in other types of insurance during the decade 1937–46, World War II dominated the panorama of marine insurance markets of the world. The years 1937 to Sept. 1939 provided the prologue; the years 1940 to Dec. 1941, Act I; 1942 to V-J day in 1945, Act II; and the remainder, an incomplete Act III. Admitting this premise, it is perhaps more appropriate to set forth the highlights as respects war risk insurance to shipping first.

In 1937 the Spanish Civil War and the Sino-Japanese "incident" provided the backdrop. For the first time marine underwriters were face to face with the actuality of serious losses resulting from the practice of providing protection against war risk to cargoes while on shore, by extending the coverage from warehouse to warehouse to coincide with the marine policy. By chance, the majority of losses which resulted from this peacetime practice fell on the nonmarine market. Nonetheless, the object lesson was not wasted, and marine underwriters over the world gave serious consideration not only to the dangers inherent in any shore coverage against war perils, but also to the possibility of catastrophic losses from aerial bombing. In World War I, and prior, if a ship made harbour, its worries were largely over, but this was no longer true. The first step was to eliminate war risk shore coverage in areas of active conflict. This was followed, on Feb. 1, 1938, by a decision to limit war risk protection to "waterborne only," even to the extent of restricting the coverage to the overseas vessel.

As the war clouds continued to spread from the far east and Europe, it became increasingly apparent that a major war would bring disruptions that would necessitate a large degree of independence from reinsurance. In Great Britain, "king's enemy" risks were reinsured by the government. In the United States, practically all underwriters pooled their resources in a reinsurance exchange. In Sept. 1939 the British War Risk Insurance office started operation. In the spring of 1942 the U.S. War Shipping administration established a wartime insurance division, but acted through private companies as agents. The private market, however, continued very active as respects cargo war risk insurance. Other interesting developments were the establishment in 1939 in the United States of a fund of \$40,000,000 by Lloyd's to provide dollar funds from which to pay losses, and the formation, for security reasons, of the British Insurance Communications office, known as "Bico," for channelling necessary information.

Hull war risk was absorbed by the U.S. and British

governments as the entire merchant marine was requisitioned by the respective Allied governments which prevented, quite properly, the divulging of routing so necessary to an underwriter. Also, the nazi submarine activity off the east coast of the United States, especially in the spring of 1942, had wiped out the underwriting profit of 20-odd years of the American Hull syndicate, necessitating a scale of rates which the War Shipping administration did not consider economically feasible.

With the exception of the entrance of the various governments into the business of war and some marine insurance, the scene remained comparatively static thereafter. Even the shock of Pearl Harbor and the staggering advance of the Japanese across the Pacific and Indian oceans did not necessitate a change in the mechanics of war risk insurance.

As a result of the Spanish Civil War, all underwriters decided to remove the ancient risk of piracy from the marine policy and place it under the war policy. Drastic changes in insuring conditions also resulted from the decision of the house of lords in the "Coxwold" case, (Yorkshire Dale Steamship Co. Ltd. v. Minister of War Transport—1942 Appeal Cases 691.) The effect of this ruling was to hold war risk underwriters responsible for some hazards previously thought covered under marine policies. The British market met the situation by redefining the F. C. & S. clause so as to place such hazards plainly under the marine policy. The U.S. market took the opposite action, by placing the risks under the war policy.

Conditions, directly the result of the war, increased immeasurably the hazards of navigation. Briefly, vessels sailing in convoy and without lights, maintaining radio silence, lack of weather reports, extinguishing of lighthouses, removal of buoys and other aids to navigation, created a situation whereby the insurance against sea perils had to be compensated for by higher premiums by way of surcharges.

For security reasons shippers were prevented from complying with the provisions in marine policies to notify underwriters of deviations, etc. To solve this difficulty clauses were adopted known as the marine extension clauses or combined marine surcharge, which extended the policy automatically during any occurrence beyond the control of the assured. In consideration of this coverage underwriters assessed an additional premium on all shipments which were combined with the aforementioned surcharges for simplicity of handling.

Following cessation of hostilities, other causes of losses began to appear. This condition became world-wide. Probably the Philippines and the far east presented the worst picture, where thefts assumed the proportions of organized looting. Even in the great port of New York, thefts and pilferages of cargoes were deplorable. The situation became so serious that a bureau was formed by shipowners, underwriters, railroads, warehousemen and other maritime interests, backed by a considerable sum of money, to approach scientifically the problem of suppression of theft and pilferage.

In the Hull market, the decade witnessed the largest placing in marine insurance history, the builder's risk on the "Queen Elizabeth." This insurance, as well as the navigating risk on the vessel, and its sister ship, the "Queen Mary," were placed through Lloyd's and the British companies, and absorbed, by way of reinsurance, the entire capacity of the world market. The period also marked the

coming of age of the American Marine Hull Insurance syndicate, founded in 1920, with government sanction and moral support, to provide an adequate, domestic market for U.S. shipowners. Over the years the syndicate grew conservatively until at the time of Pearl Harbor it had a capacity of \$4,000,000 for any one hull. During the grim days in the spring of 1942, the height of the German submarine campaign, the syndicate suffered losses in excess of \$25,000,000. Nonetheless, the syndicate continued to grow, and before the end of the war had expanded to include the insuring of foreign hulls, heretofore the almost exclusive prerogative of the London market.

In the U.S. market an agreement, was reached between the War Shipping administration and the syndicate, whereby those vessels which had been operated by their owners under a time form of charter, continued to be insured in the commercial market. The unusual features of this wartime hull agreement were that the syndicate members agreed to limit any underwriting profit to a maximum of 7%, but placed no complementary stop-loss provision in the agreement, and named one rate applicable throughout the world rather than different rates for various trades.

U.S. underwriters watched closely the effects of the South-Eastern Underwriters association case decided by the U.S. supreme court, which made marine insurance for the first time subject to interstate commerce regulation.

All in all, the years 1937-46 marked an important period in marine insurance, both hull and cargo. The industry weathered the war years and emerged stronger and more flexible. Troublesome times were still ahead, with all the uncertainties of drastic economic readjustments and of the huge task of reconstruction. The tools, however, were there and had been successfully tested. (H. C. TN.)

Hospital Insurance.—The story of hospital insurance in the decade 1937–46 was that of a growing conflict between two ideas, and a surging interest on the part of people everywhere in obtaining advance financial protection against the catastrophic costs of illness. Competition between the theory of state-controlled, compulsory programs and that of privately-operated, voluntary plans heightened during the decade as coverage and interest in both types of protection increased.

In the United States the compulsory idea was late in reaching legislative halls. Not until 1941 was the first version of what eventually became the Murray-Wagner-Dingell bill, hotly debated in 1945 and 1946, introduced in congress by Sen. Arthur Capper of Kansas. Not until 1942 did a state, Rhode Island, pass a compulsory sickness insurance law, and this did not directly include hospitalization coverage. Meanwhile the voluntary programs of Blue Cross, commercial insurance companies and other organizations expanded their membership.

Elsewhere, compulsory programs were well under way before the start of the decade. In England, Germany, Austria, the Scandinavian countries, New Zealand, the Netherlands and other countries, compulsory state-operated systems had been established for upward of two decades before 1937. In most of these countries, the vast majority of the population was early covered by hospital insurance. In most, protection was almost completely disrupted by

World War II, and figures or details of coverage were almost impossible to obtain with accuracy in 1946. Privately-operated plans were almost nonexistent outside the United States

Blue Cross, in the United States and Canada, was almost entirely a social phenomenon of these ten years. On Jan. 1, 1937, there were 534,745 members in a handful of small, scattered, unco-ordinated, nonprofit plans for hospital care. The idea itself, of community-wide plans to permit prepayment of hospital bills through a community agency, was new, and the name "Blue Cross" was just then coming into use in Minnesota.

Indicative of the mushrooming growth of these plans after 1937, under the official sponsorship of the American Hospital association, was the fact that new enrolment during the first 9 months of 1946 was nearly 4,500,000—almost exactly the total number who had been enrolled by Jan. 1, 1940, after up to 8 years of activity by the 63 approved plans then functioning. By the end of 1946, total enrolment in the 87 plans approved by the A.H.A. had reached nearly 26,000,000, and was increasing at the rate of 25,000 persons every working day.

Previously, the problem of how to pay for services needed by individuals, usually without advance knowledge, had been met by many through time payments, aided by public charity and private philanthropy. Inability to pay caused countless decisions to delay hospital care which was badly needed. The idea of voluntary prepayment had been used to a limited extent by individual companies and single hospitals, but not until 1931, in Sacramento, Calif., and 1932, in Newark, N.J., did a group of hospitals combine to offer prepayment to an entire community.

There was no more important development than Blue Cross in the field of medical economics during the decade ending in 1946. Plans functioned as independent, local service organizations, operated on a nonprofit basis with hospital, lay and medical sponsorship, usually under special state enabling legislation. They were required to meet standards set by the A.H.A. By 1946 plans served 45 states (all but Arkansas, Mississippi and South Carolina), seven Canadian provinces and Puerto Rico. Payment for services was made directly to the hospital; in 1946 27% of the income of the nation's general hospitals came from Blue Cross plans on behalf of members.

In 1937 the Julius Rosenwald fund made a grant of \$100,000 to the A.H.A. for research in the field of hospital economics. As a result, the need for co-ordination of the activities of scattered plans became apparent, and the Commission on Hospital Service Plans was established to organize and stimulate their development. This body, which changed its name in 1946 to "Blue Cross commission," took the lead in expanding nonprofit, prepaid health service programs throughout the decade.

Forty-eight of the plans were, in 1946, co-ordinated with 43 parallel nonprofit medical or surgical plans, with more than 4,000,000 members. These plans, covering or allowing credit towards the fees of surgeons, and in many cases some payment for medical service, developed later than hospital service plans. Not until 1945 did membership begin to mount rapidly.

Typically, a Blue Cross plan in 1946 was providing service benefits in member hospitals—3,800 in all plans—regardless of the cost of care needed, for periods averaging about 35 days per year for each member of a family enrolled, and for an additional period of from 30 to 180 days at half credit. Hospital services included care in a semiprivate room, board, including special diets, laboratory, operating room, delivery room, emergency room.

drugs and medicines, dressings and casts and any of a variety of extra services which might include anaesthesia, X-ray, electrocardiograms, physiotherapy, oxygen-therapy, basal metabolism tests, pathology, ambulance, etc. Services covered varied from plan to plan.

To render service to members throughout the world, plans were co-operating in programs covering transfer of members, reciprocal service benefits, enrolment of national firms and other subjects. Coverage was available in any approved general hospital anywhere in the world. Rates averaged about \$.85 per month for an individual and \$2.10 per month for a family.

Although the basic pattern of Blue Cross still involved enrolment of groups of employed persons and their dependents through their places of employment, nearly all plans had begun to offer membership to those who were self-employed, retired or unemployed, or otherwise unable to join through a group. Originally, enrolment came almost entirely from city dwellers, but by 1946 nearly 2,000,000 rural residents had enrolled.

During the entire decade, 1937-46, C. Rufus Rorem served as director of the Blue Cross commission. He submitted his resignation, effective Jan. 1, 1947, however, to become executive director of the newly-formed Hospital council of Philadelphia, Pa. His leadership played a major part in guiding the growth of the movement.

Commercial group hospitalization insurance in the United States had been extended by 1946 to about 8,800,000 persons; another 1,000,000 held individual policies. About 5,500,000 persons held commercial protection against surgical expense, and somewhat less than 500,000 for medical expense. In addition, 1,250,000 persons were members of industrial medical service plans, including hospitalization, but membership in this type of program was declining. Co-operatives and group clinics providing for hospital care covered about 600,000, but this type of program showed relatively little growth during the period.

Commercial-type programs differed from Blue Cross hospital service plans in that they offered protection on an "indemnity" rather than a "service" basis. Typical commercial group hospital programs covered from 30 to 71 days of care with a room allowance of \$5 or \$6 and up to \$50 or \$60 for extra services, such as laboratory, X-ray, anaesthesia, etc. It was not possible to continue membership after leaving the employed "group." Payments were made to the insured individual rather than to the hospital.

In addition to the above, some 6,000,000 persons carried commercial group accident and health insurance, some of which provided some coverage for certain types of hospitalization.

Legislative interest in hospital insurance in the United States centred principally in the various bills introduced by Senators Robert F. Wagner and James E. Murray, and Congressman John D. Dingell, and the 1946 proposals of Senators Robert A. Taft, Joseph H. Ball and H. Alexander Smith. The former proposals would include flat per diem allowances toward the cost of hospital care in an expanded social security program. Although frequently introduced after 1941, and supported by Presidents Roosevelt and Truman, none of the bills was ever discharged from committee. The most extensive hearings were held in 1946.

The Taft-Ball-Smith bill embodied grants-in-aid to state-approved programs, which could be Blue Cross, for medical and hospital aid to those deemed "medically indigent," supported by general taxation.

Several states proposed or passed laws touching on the

subject. Rhode Island added a sickness indemnity to its unemployment compensation program. California required all employed persons to carry sickness insurance with a private carrier or through the state-established fund. Although these acts were not strictly "hospital" insurance, they were the closest approaches to such a program actually adopted in any state, and were intended to help compensate for loss of income or expense of serious illness including hospitalization.

At the end of 1946, union-operated health and welfare programs, including hospital insurance through Blue Cross or commercial carriers, were increasingly included in labour agreements. A notable example was that of the United Mine Workers.

Interior Decoration

In 1937 interior decoration was experiencing normal evolution of ideas and methods geared to a corresponding evolution in public acceptance. This normal progression stopped in most countries during World War II.

The following period (after 1939 in Europe and after 1941 in the United States) was characterized by improvisation, by temporary arrangements suitable to the flux of living conditions, by lack of interchange of ideas and materials among countries (except to a small extent among the Americas), by ingenious utilization of local materials, and by a tendency to confine limited manufacture to simple contemporary design while at the same time reviving

Above: Bed designed to conform to circular shape of room, with attached control table for radio and telephone

Above: Dinette emphasizing the simplicity and beauty of wood with ornamental work, shelf supports, drawer handles and legs of table made of brass

Right: Functional design in built-in cabinets for dining area and tile floored alcove for the fireplace

(in the U.S.) a modified form of the Victorian décor of the '90s, numerous examples of which were available in reparable state.

Although the building of new homes was negligible, there was a limited amount of remodelling which showed increasing emphasis on fenestration—the use of double-pane vacuum-sealed "picture windows," for instance; on well-organized kitchens; on elimination of the separate dining room in small homes; on practical well-designed storage space as an integral part of the room; and on the elimination of all nonessentials. There was a tendency for the architect to direct the interior decoration of the house of contemporary design.

Textiles.—In France very fine printed textiles were developed about 1937, using contemporary design, on silk to a great extent. At the same time Germany and the Scandinavian countries had on the market a variety of new textiles emphasizing open weaves and textures developed by the employment of twisted, textured yarns. In the U.S. the use of glass fibre threads, synthetic threads and laminated plastic on fabric already was established.

With the spread of war, little of importance in the textule field was developed except in Central and South America and in a limited way in the U.S., notably in California. Primitive designs woven in Bolivia, Chile and Peru were imported in small quantity into the U.S. In Mexico the printed woollens and cottons from Cuernavaca were recognized as a particularly significant contribution. California experimented successfully with tinsels, metals, plastics and novel yarns, producing materials in unusual weaves which found wide popular favour.

During the war textiles played an important role as a flexible and simple means of decoration. Window curtains were relied upon to set the decorative scheme. The ruffled cottage curtain continued in vogue but simple curtains of rayon, plastics and coarse weaves increased in popularity. Upholstery material was severely limited, but slip covers were widely used to cover old furniture or to brighten a room. The demand far exceeded the supply of material. Textiles were also used as wall coverings and were effectively installed on runners to divide rooms at any time desired. The use of table mats in decorative weaves employing novel materials supplanted traditional table linen to a great extent.

Rugs.—In England, western Europe and Scandinavia, prior to World War II, texture rugs were developed and fur was also used. The U.S. likewise was producing twisted piles and open weaves in cotton and wool, and stressing simple reversible rugs. During the war colours were limited to a few stock shades and output was very limited. A few black sheep rugs were imported from South America. Oriental rugs in stock continued to be used throughout the war, but the trend toward simple texture rugs increased. The completely carpeted floor became uncommon. Plastic-coated paper rugs, thick, cheap, washable, reversible and sturdy, were developed in the U.S.

Furniture.—Throughout the decade 1937-46 there was a substantial demand for traditional furniture in the U.S., but at the same time a great increase in demand for contemporary design. Before the war "Swedish Modern" was widely available through retail outlets and exerted an influence on popular taste. Early American and 18th century antiques and reproductions were in steady demand, and about 1938 there was a brief revival of Regency. Later there was a revival of late Victorian, stimulated by the fact that there was still an abundance of originals which could be rebuilt and redecorated despite raw material shortages. The trend toward built-in and sectional furniture in-

creased. The work of Eero and Eliel Saarinen and Charles Eames at Cranbrook, Michigan, in making laminated plywood furniture in functional forms was of significance. In New York, Artekpascoe (of Finnish derivation) made furniture and accessories based on simplified traditional structure and characterized by simple upholstery including natural hides.

There was a healthy and fresh tendency to bring the outdoors indoors by means of fenestration and decorative plants and, equally where possible, to bring the indoors outdoors, making patios and terraces into outdoor rooms. The demand for outdoor furniture increased, but standardized metal furniture in chrome-steel, aluminum and iron was difficult to obtain during the war years. Some very attractive sturdy outdoor furniture of handwoven cane and reed on natural wood frames was made in Mexico.

Walls.—Wall surfaces were, for the most part, treated very simply during the decade. The most common base was plaster and, where old paper was impossible to replace, the application of one coat of casein paint was popular. Because of the shortage of pigments, "wallpaper paints" were confined to pastel mat tones and there was a tendency also to align the woodwork to the wall tone. Very little wallpaper was designed or manufactured because of wartime shortages. An absolutely stainproof washable paper was produced. Blown-up photographs were used effectively as murals.

Plywood proved an attractive and desirable wall surface because of low maintenance costs. Likewise, the application of veneers to insulating materials proved practical and effective. Veneers of strong pattern were artificially developed by powerful bleaches.

Common brick and tile for interior walls were used; both these materials were highly practical, being low in cost as well as interesting in texture. In brick or tile construction neither side of the material required surface treatment and one wall served as two. Corrugated glass and various translucent plastics, as well as glass brick, were widely used in wall treatment, not only in limited new building but also in modernization of old units. Screens of light-weight materials in simple wood frames were a popular means of dividing rooms.

Floors.—The favoured material for flooring continued to be traditional hardwood. However, tile and brick were used successfully and were more in demand because of shortages in seasoned hardwood. There was a steady demand for inlaid linoleum, very little of which was available. The importation of cork was entirely cut off by the war.

Lighting.—Throughout World War II the use of tubular fluorescent lighting mounted steadily. Cove and indirect lighting—important factors in contemporary interiors—were logical methods for utilizing the slm line structure of the fluorescent tube. It was also used over windows to reflect the colour or decorative pattern value of curtains. Its cheaper maintenance and cool light further recommended it to the general public. Spot and pin-aperture lighting were also used to create facets in the total composition of an interior. The trend toward unobtrusive light sources and the dramatic use of light itself was marked. Ceiling fixtures and side brackets were becoming outdated. Some floor and table lamps were also designed for indirect light with ceiling floods, movable arms and generally more functional shape.

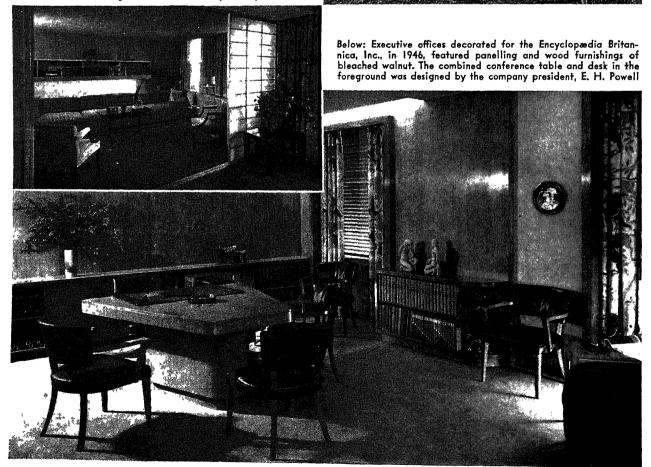

Ceramics.—The ten years 1937-46, with their stress on informal living, saw a revival of earthenware ceramic table-

Above: Architectural table unit in the foreground houses air conditioning ducts and forms the background for a sofa

Right: Living room emphasizing simple use of materials with recessed brass flower holders in the table, plastic table top and built-in sofa

Below: Living room showing the adaptation of traditional furniture with modern background and modern upholstery materials

ware and decorative bowls, vases, figurines and miscellaneous vessels. Whereas the majority was mass-produced, there was a lively demand for the more differentiated product of individual potter-craftsmen, working alone or with small staffs. This encouraged a limited renascence of the craft in Europe and in the U.S., particularly in the far west and east. Good shapes and good glazes were developed in spite of wartime shortages of chemicals. In England, Bernard Leach did important work in re-establishing the Chinese and Japanese tradition as a basis for western development. Ceramics as an art form sold well in galleries and museums. Inexpensive mass-produced tableware in gay colours, as in fiesta ware, or in good contemporary design, as in the Russell Wright line, found great popular demand.

Plants.—The decorative value and interest of large leaf plants such as Ficus Pendurata and the use of climbing or trailing plants such as Philodendron Cordatum or Philodendron Pertussum which thrive with proper care in city or country were demonstrated particularly in interiors of contemporary design where a single large plant was often a feature of a planned room.

Public Buildings.—There was very little public building during the decade, but some projects were completed in the U.S. before the war. Almost all were executed in contemporary design, using basic materials such as brick, tile and metal sash with honest exploitation of their intrinsic decorative values. Fenestration was used either to the limit or else practically eliminated by means of air-conditioning and controlled lighting. (G. M. J.)

International Bank for Reconstruction and Development

The International Bank for Reconstruction and Development was established in 1945 as one of three principal organs of world economic policy, the others being the International Monetary Fund (q.v.) and the International Trade organization. Shortly after Pearl Harbor, technicians of the United States and other United Nations, seeking to provide the economic basis for the type of postwar world for which the nations were fighting, began to exchange ideas and plans for institutions designed for international monetary co-operation and management and the financing of reconstruction and development. The United Nations Monetary and Financial conference at Bretton Woods in July 1944 formulated agreements for the International Monetary Fund and the International bank which, on being accepted by the requisite number of nations, were declared operative on Dec. 27, 1945. The inaugural meetings of the boards of governors of the two institutions were held at Savannah, Georgia, in March 1946, and the first regular annual meeting was held in Washington in Sept. 1946. The bank's executive directors had been in continuous session since May 7, 1946, in Washington, D.C., site of the bank's principal office.

The purposes of the bank were outlined as follows: to assist in the reconstruction and development of member nations by facilitating investment of capital for productive purposes; to promote private foreign investment by means of guarantees or participations in loans and other investments made by private investors, and when private capital is not available on reasonable terms to supplement private investment by providing finance out of resources available to it; and to promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments by encouraging international investment for the development of the productive resources of members. The authorized capital of the bank was \$10,000,000,000,000. The total of its outstanding loans and

guarantees could not exceed its subscribed capital, reserves and surplus. The bank at the end of 1946 had 40 member countries who had subscribed for a total of \$7,790,500,000. Membership in the bank remained open until Dec. 31, 1946, for those countries which participated in the Bretton Woods conference. Other nations could be admitted by the board of governors.

The subscribed capital consisted of two parts—20% to serve as the bank's working capital (one-half of the 20% called for payment by Nov. 25, 1946) and 80% to be held and called only to make good on the bank's outstanding obligations or guarantees.

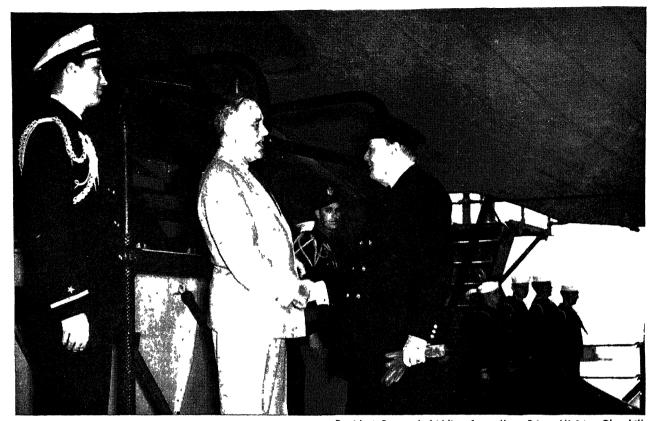

The bank was authorized to make or facilitate loans in the following ways: (1) by making direct loans out of its own funds corresponding to its unimpaired paid-up capital, surplus and reserves; (2) by making direct loans out of funds raised in the market of a member country, or otherwise borrowed; and (3) by guaranteeing in whole or in part loans made by private investors through the usual investment channels. Loans made or guaranteed by the bank had to be, in general, for specific projects or programs of reconstruction or development. In accordance with this principle, the bank had to make arrangements to insure that the proceeds of each loan were used only for the purposes for which the loan was granted. Competent technical committees appointed by the bank were required to make a careful study of the merits of each proposed loan, and the executive directors could not make the loan unless the committee had submitted a written report recommending it. On every loan made or guaranteed by the bank which was not a direct obligation of a member country-that is, where the loan was made to a political subdivision or a private enterprise within the country-the repayment of principal and the payment of interest and other charges had to be fully guaranteed by the member government or its central bank or some comparable agency acceptable to the International bank. The interest rate, other charges, and schedule of principal repayment were required to be "appropriate to the project," and the bank had to pay due regard to the prospects of the borrower's position to meet its obligations under the loan.

The International bank by the fall of 1946 had established the framework of its organization and was considering the first application for loans submitted to it. (See also Banking; Exchange Control and Exchange Rates; International Conferences, Allied (World War II); International Monetary Fund; Tariffs; United Nations.)

International Conferences, Allied (World War II)

In spite of Adolf Hitler's oft-repeated assurances to the world that he planned no military conquests, war seemed imminent in the early days of 1938. At conferences such as those of the Scandinavian neutrals at Stockholm in May 1938 and the meetings of representatives of Pan-American states, considerations for future courses of action in the event of world conflict occupied much attention. (For a discussion of the latter conferences prior to and during World War II, see PAN-AMERICAN CON-FERENCES, 1937-46.) Such meetings, however, were mostly regional until the historic Atlantic Charter meeting of Prime Minister Winston Churchill and President Franklin D. Roosevelt, some four months before Pearl Harbor. Beginning with that meeting, the present article lists the principal Allied conferences during the course of the war, and the major decisions of each.

President Roosevelt bidding farewell to Prime Minister Churchill after the historic Atlantic Charter meeting at sea in Aug. 1941. The President was accompanied by his sons Franklin, Jr. (left) and Elliott (centre background)

The Atlantic Charter.-President Roosevelt and Prime Minister Churchill of Great Britain held their first wartime meeting on Aug. 9 and 10, 1941, at sea, alternately aboard the U.S. cruiser "Augusta" and the British warship "Prince of Wales." During these meetings an 8-point declaration was formulated and issued officially on Aug. 14 as the Atlantic Charter. This document declared:

The President of the United States of America and the Prime Minister, Mr. Churchill, representing His Majesty's Government in the United Kingdom, being met together, deem it right to make known certain common principles in the national policies of their respective countries on which they base their hopes for a better future for the world.

First, their countries seek no aggrandizement, territorial or

Second, they desire to see no territorial changes that do not accord with the freely expressed wishes of the peoples concerned:

Third, they respect the right of all peoples to choose the form of government under which they will live; and they wish to see sovereign rights and self-government restored to those who have been forcibly deprived of them;

Fourth, they will endeavor, with due respect for their existing obligations, to further the enjoyment by all States, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity;

Fifth, they desire to bring about the fullest collaboration between all nations in the economic field with the object of securing, for all, improved labor standards, economic adjustment and social security;

Sixth, after the final destruction of the Nazi tyranny, they hope to see established a peace which will afford to all nations the means of dwelling in safety within their own boundaries, and which will afford assurance that all the men in all the lands may live out their lives in freedom from fear and want;

Seventh, such a peace should enable all men to traverse the

high seas and oceans without hindrance;

Eighth, they believe that all of the nations of the world, for realistic as well as spiritual reasons, must come to the abandonment of the use of force. Since no future peace can be main-

tained if land, sea or air armaments continue to be employed by nations which threaten, or may threaten, aggression outside of their frontiers, they believe, pending the establishment of a wider and permanent system of general security, that the disarmament of such nations is essential. They will likewise aid and encourage all other practicable measures which will lighten for peace-loving peoples the crushing burden of arma-

First United Nations Conference.—On Jan. 1, 1942, Prime Minister Churchill, after a three-day visit in Ottawa, Canada, arrived in Washington, D.C., to discuss military, financial, economic and supply problems with President Roosevelt. At this meeting, on Jan. 2, representatives of 26 countries at war with the axis nations signed a declaration by the United Nations pledging themselves not to conclude a separate peace and to prosecute the war with their full military and economic resources. The original signatories of this pact, besides President Roosevelt and Prime Minister Churchill, were representatives of Australia, Belgium, Canada, China, Costa Rica, Cuba, Czechoslovakia, Dominican Republic, El Salvador, Greece, Guatemala, Haiti, Honduras, India. Luxembourg, the Netherlands, New Zealand, Nicaragua. Norway, Panamá, Poland, South Africa, the U.S.S.R. and Yugoslavia, (See United Nations.) Following is the text of the final part of the declaration:

- (1) Each government pledges itself to employ its full resources, military or economic, against those members of the Tripartite Pact and its adherents with which such government
- (2) Each government pledges itself to co-operate with the governments signatory hereto and not to make a separate armistice or peace with the enemies.

Casablanca Conference.-On Jan. 15, 1943, President

Roosevelt and Prime Minister Churchill met at Casablanca, French Morocco, for a ten-day meeting at which Generals Charles de Gaulle and Henri Giraud of France participated. Here it was decided to take the initiative in the war, and to accept nothing short of unconditional surrender from the axis nations. It was further agreed that these representatives would confer later with Premier Joseph Stalin of the U.S.S.R., and to supply material aid to that country and to China. Another stated objective was to unite the French in the war against the axis.

Washington ("Trident") Conference.-Prime Minister Churchill arrived in Washington, D.C., on May 11, 1948,1 for a series of conferences (known by the code name of "Trident") with President Roosevelt on the future prosecution of the war. On May 27, President Roosevelt announced that Great Britain and the United States had reached full agreement on all phases of future operations. As later revealed in the 1945 biennial report of General George C. Marshall, the "specific strategy of the global war" was conceived at this conference, and it was determined to speed up the campaign against Japan. The Burmese campaign of the following fall was laid out, and plans were approved to increase the air route capacity over "the Hump" to 10,000 tons a month (later increased to 20,000 at the First Quebec conference). The conferees also agreed upon the invasion of France from Great Britain.

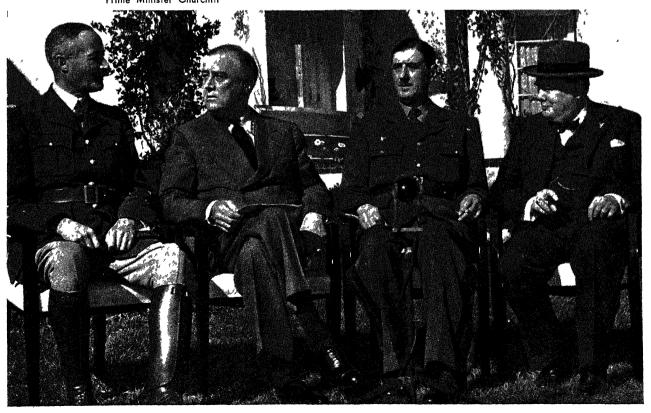

First Quebec ("Quadrant") Conference.—On Aug. 10, 1943, Prime Minister Churchill and Prime Minister King of Canada met at Quebec to co-ordinate plans for the invasion of Europe. President Roosevelt arrived on Aug. 17. Secretary of State Cordell Hull and Secretary of State

¹Churchill had made two prior trips to Washington for conferences with President Roosevelt—in Dec. 1941 and June 1942.

The conference at Casablanca, Morocco, where Allied leaders met in Jan. 1943 to discuss European war strategy. Left to right are: Gen. Henri Giraud, Pres. Roosevelt, Gen. Charles de Gaulle and Prime Minister Churchill for Foreign Affairs Anthony Eden also were present at this conference, known as "Quadrant," which lasted until Aug. 24. It was revealed later that the specific routes of the advance against Japan (Gilberts, Marshalls, Marianas, Ryukyus) were determined at this conference. General Henry H. Arnold's plans for air warfare against Japan, detailing the establishment of bases for the B-29 superfortresses, were also approved. The Southeast Asia command under Lord Louis Mountbatten was created. The offensive against southern France, in conjunction with the Normandy campaign, was conceived at "Quadrant."

Moscow Conference (1943).—In Oct. 1943, representatives of the United States, Great Britain and the U.S.S.R. met at the Kremlin and recognized China's position as one of the Big Four powers at war with the axis. On Nov. 1, after 13 days of meetings, the representatives resolved to continue the war until the axis should surrender unconditionally, and pledged unified action for eventual peace and security. They also recognized the need for a general international organization for peace in the nature of a league of nations, and agreed not to maintain their respective armed forces within the territories of other nations after cessation of hostilities. They vowed, furthermore, that Austria should be freed from naziism, that Italy should be democratized and that war criminals should be returned to the scene of their crimes for trial and punishment. This agreement, signed by the United States, Great Britain and the U.S.S.R., was later ratified by the United States senate by a vote of 85 to 5. The full text of the agreement on Italy was as follows:

The foreign secretaries of the United States, the United Kingdom and the soviet union have established that their three governments are in complete agreement that Allied policy toward Italy must be based upon the fundamental principle that fascism and all its evil influence and configuration shall be completely destroyed and that the Italian people shall be given

every opportunity to establish governmental and other institu-688 tions based upon democratic principles.

The foreign secretaries of the United States and United Kingdom declare that the action of their governments from the inception of the invasion of Italian territory, in so far as paramount military requirements have permitted, has been based upon this policy.

In furtherance of this policy in the future the foreign secretaries of the three governments are agreed that the following measures are important and should be put into effect:

(1) It is essential that the Italian government should be made more democratic by inclusion of representatives of those

sections of the Italian people who have always opposed fascism.

(2) Freedom of speech, of religious worship, of political belief, of press and of public meeting shall be restored in full measure to the Italian people, who shall also be entitled to form anti-fascist political groups.

(3) All institutions and organizations created by the fascist

regime shall be suppressed.

(4) All fascist or pro-fascist elements shall be removed from the administration and from institutions and organizations of a public character.

(5) All political prisoners of the fascist regime shall be re-leased and accorded full amnesty.

(6) Democratic organs of local government shall be created. (7) Fascist chiefs and army generals known or suspected to be war criminals shall be arrested and handed over to justice.

In making this declaration the three foreign secretaries recognize that so long as active military operations continue in Italy the time at which it is possible to give full effect to the principles stated above will be determined by the commanderin-chief on the basis of instructions received through the combined chiefs of staff.

The three governments, parties to this declaration, will, at the request of any one of them, consult on this matter. It is further understood that nothing in this resolution is to operate against the right of the Italian people ultimately to choose their own form of government.

Following is the text of the declaration on Austria signed at Moscow:

The governments of the United Kingdom, the soviet union and the United States of America are agreed that Austria, the first free country to fall a victim to Hitlerite aggression, shall be liberated from German domination.

They regard the annexation imposed on Austria by Germany on March 15, 1938, as null and void. They consider themselves as in no way bound by any changes effected in Austria since that date. They declare that they wish to see reestablished a free and independent Austria and thereby to open the way for the Austrian people themselves, as well as those neighbouring states which will be faced with similar problems, to find that political and economic security which is the only basis for lasting peace.

Austria is reminded, however, that she has a responsibility, which she cannot evade, for participation in the war at the side of Hitlerite Germany, and that in the final settlement account will inevitably be taken of her own contribution to her liberation.

Cairo ("Sextant") Conference. - President Roosevelt, Prime Minister Churchill and Generalissimo Chiang Kaishek agreed, at Cairo, Egypt, Nov. 22-26, 1943, on military plans against Japan. In a statement dated Dec. 1, the three nations determined "that Japan shall be stripped of all the islands in the Pacific which she has seized or occupied since the beginning of the first World War in 1914, and that all the territories Japan has stolen from the Chinese, such as Manchuria, Formosa and the Pescadores, shall be restored to the Republic of China." They further resolved that Korea should "in due course . . . become free and independent."

Tehran Conference.-From Cairo President Roosevelt and Prime Minister Churchill flew to Tehran, Iran, to meet Marshall Stalin in a 4-day conference, Nov. 28 to Dec. 1, 1943. Here they formulated plans for an all-out attack on Hitler's European bastion, and agreed on the scope and timing of their assault on the axis. Iran's

Far eastern strategy was the subject of most discussions at the Cairo conference in Egypt during Dec. 1943. Pres. Roosevelt and Prime Minister Churchill posed informally between meetings, with Pres. Ismet Inonii of Turkey (centre)

assistance to the Allied cause was recognized, and aid was promised this nation in its resistance to axis threats. From Tehran, Roosevelt and Churchill returned to Cairo, where they conferred with President Ismet Inönü of Turkey. Dec. 4-6, 1943, for the purpose of strengthening Turkey's stand against the axis.

Following is the declaration adopted at Tehran regarding Iran's status:

The President of the United States of America, the Premier of the U.S.S.R. and the Prime Minister of the United Kingdom, having consulted with each other and with the Prime Minister of Iran, desire to declare the mutual agreement of their three governments regarding relations with Iran.

The governments of the United States of America, the U.S.S.R. and the United Kingdom recognize the assistance which Iran has given in the prosecution of the war against the common enemy, particularly by facilitating the transportation of supplies from overseas to the soviet union. The three governments realize that the war has caused special economic difficulties for Iran and they agreed that they will continue to make available to the Iran government such economic assistance as may be possible, having regard to the heavy demands made upon them by their world-wide military operations and to the world-wide shortage of transport, raw materials and supplies for civilian consumption.

With respect to the postwar period, the governments of the United States of America, the U.S.S.R. and the United Kingdom are in accord with the government of Iran that any economic problem confronting Iran at the close of hostilities should receive full consideration along with those of other members of the United Nations by conferences or international agencies, held or created, to deal with international economic matters.

The governments of the United States of America, the U.S.S.R. and the United Kingdom are at one with the government of Iran in their desire for the maintenance of the independence, sovereignty and territorial integrity of Iran. They count upon the participation of Iran, together with all other peace-loving nations in the establishment of international peace, security and prosperity after the war, in accordance with the principles of the Atlantic Charter, to which all four governments have continued to subscribe.

At the time of the Tehran conference, Turkey's entrance into the war on the side of the Allies was held very desirable. Toward this end, a secret agreement was signed by the Big Three which remained undisclosed until March 25, 1947. It provided that in pertinent negotiations with

Turkey, it was to be stated that if hostilities opened between Turkey and Germany followed by an attack on the former by Bulgaria, "the soviet would immediately be at war with Bulgaria."

Dumbarton Oaks Conference.—(See UNITED NATIONS.) Second Quebec ("Octagon") Conference.—On Sept. 16, 1944, President Roosevelt and Prime Minister Churchill concluded their second Quebec conference, in which they pledged the Allies to shift their full force to the Pacific theatre of war to defeat Japan as soon as Germany should surrender. At this conference, known as "Octagon," General Douglas MacArthur was directed to advance the "target date" of the Philippines invasion to Oct. 20, 1944.

Crimea or Yalta ("Argonaut") Conference.-From Feb. 4 to 11, 1945, President Roosevelt and Prime Minister Churchill and their advisers conferred with Marshal Stalin in the Crimea, near Yalta on the Black sea coast. Previously, Churchill and Roosevelt had met at Malta in the Mediterranean. The conference at Yalta was concerned with achieving closer co-ordination among the Big Three and formulating final plans for the defeat of the common enemy. Policies were agreed upon for enforcing the unconditional surrender of Germany, although the terms of such surrender were to remain secret until after the final defeat. Other decisions reached were: that Germany should be divided into zones to be occupied and policed under "co-ordinated administration" by the armed forces of the Big Three, a fourth zone being offered to the French for their administration if that country should so desire; that a commission on German reparations should be set up in Moscow; that the first conference of the United Nations should convene in San Francisco on April 25, 1945; and that there should be regular consultation of the Big Three foreign secretaries, "probably about every three or four months." Finally, three important statements of policy were issued regarding the nations of liberated Europe, the new Polish frontiers and the Tito government in Yugoslavia. The text of these three agreements, dated Feb. 11, 1945, is set forth below:

Declaration on Liberated Europe

The Premier of the Union of Soviet Socialist Republics, the Prime Minister of the United Kingdom, and the President of the United States of America have consulted with each other in the common interests of the peoples of their countries and those of liberated Europe. They jointly declare their mutual agreement to concert during the temporary period of instability in liberated Europe the policies of their three governments in assisting the peoples liberated from the domination of Nazi Germany and the peoples of the former Axis satellite states of Europe to solve by democratic means their pressing political and economic problems.

The establishment of order in Europe and the rebuilding of national economic life must be achieved by processes which will enable the liberated peoples to destroy the last vestiges of Naziism and Fascism and to create democratic institutions of their own choice. This is a principle of the Atlantic Charter—the right of all peoples to choose the form of government under which they will live—the restoration of sovereign rights and self-government to those peoples who have been forcibly deprived of them by the aggressor nations.

To foster the conditions in which the liberated peoples may exercise these rights, the three governments will jointly assist the people in any European liberated state or former Axis satellite state in Europe where in their judgment conditions require (A) to establish conditions of internal peace: (B) to carry out emergency measures for the relief of distressed peoples; (C) to form interim governmental authorities broadly representative of all democratic elements in the population and pledged to the earliest possible establishment through free elections of governments responsive to the will of the people; and (D) to facilitate where necessary the holding of such elections.

The three governments will consult the other United Nations and provisional authorities or other governments in Europe

when matters of direct interest to them are under considera-

When, in the opinion of the three governments, conditions in any European liberated state or any former Axis satellite state in Europe make such action necessary, they will immediately consult together on the measures necessary to discharge the joint responsibilities set forth in this declaration.

By this declaration we reaffirm our faith in the principles of the Atlantic Charter, our pledge in the declaration by the United Nations, and our determination to build in cooperation with other peace-loving nations world order under law, dedicated to peace, security, freedom and general well-being of all mankind.

In issuing this declaration, the three powers express the hope that the Provisional Government of the French Republic may be associated with them in the procedure suggested.

Poland

A new situation has been created in Poland as a result of her complete liberation by the Red Army. This calls for the establishment of a Polish provisional government which can be more broadly based than was possible before the recent liberation of Western Poland. The provisional government which is now functioning in Poland should therefore be reorganized on a broader democratic basis with the inclusion of democratic leaders from Poland itself and from Poles abroad. This new government should then be called the Polish Provisional Government of National Unity.

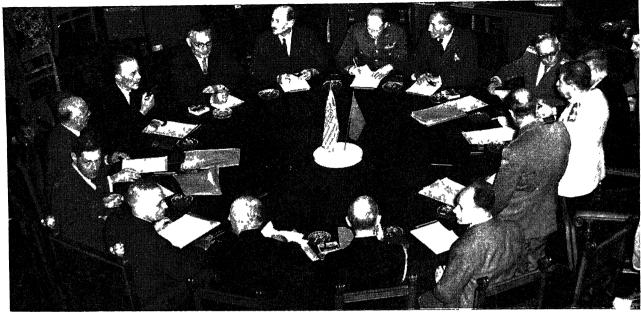

M. Molotov, Mr. Harriman and Sir A. Clark Kerr are author-

M. Molotov, Mr. Harriman and Sir A. Clark Kerr are authorized as a commission to consult in the first instance in Moscow with members of the present provisional government and with other Polish democratic leaders from within Poland and from abroad, with a view to the reorganization of the present government along the above lines. This Polish Provisional Government of National Unity shall be pledged to the holding of free and unfettered elections as soon as possible on the basis of universal suffrage and secret ballot. In these elections all democratic and anti-Nazi parties shall have the right to take part and to put forward candidates.

When a Polish Provisional Government of National Unity has been properly formed in conformity with the above, the government of the U.S.S.R., which now maintains diplomatic relations with the present provisional government of Poland, and the government of the United Kingdom and the government of the U.S.A. will establish diplomatic relations with the

Yalta airport in the Crimea, shortly after British end U.S. leaders arrived in Feb. 1945 to confer with Marshal Stalin on plans for postwar Europe. At attention during the playing of the Russian anthem are, left to right: Secretary of State Stettinius, Foreign Commissar Molotov, Prime Minister Churchill and Pres. Roosevelt

new Polish Provisional Government of National Unity, and will exchange ambassadors by whose reports the respective governments will be kept informed about the situation in Poland.

The three heads of government consider that the Eastern frontier of Poland should follow the Curzon line with digressions from it in some regions of five to eight kilometres in favour of Poland. They recognize that Poland must receive substantial accessions of territory in the North and West. They feel that the opinion of the new Polish Provisional Government of National Unity should be sought in due course on the extent of these accessions and that the final delimitation of the western frontier of Poland should thereafter await the peace conference.

Yugoslavia

We have agreed to recommend to Marshal Tito and Dr. Subasic that the agreement between them should be put into effect immediately, and that a new government should be formed on the basis of that agreement.

We also recommend that as soon as the new government has been formed it should declare that:

(1) The anti-Fascist assembly of National Liberation (Avnoj) should be extended to include members of the last Yugoslav Parliament (Skupschina) who have not compromised themselves by collaboration with the enemy, thus forming a body to be known as a temporary Parliament; and;

(2) Legislative acts passed by the anti-Fascist Assembly of National Liberation will be subject to subsequent ratification by a constituent assembly

by a constituent assembly.

There was also a general review of other Balkan questions.

In addition, a series of secret agreements were reached which were not made public in their entirety until March 1947. Chief among them were provisions concerning the dismemberment of Germany, a recommendation that the Montreux convention, under which Turkey controlled the Black sea straits, be considered at a future date for possible revision, and details of the plan for German reparations in kind. These last were to consist of the removal of German goods (including external assets) within two years of its surrender, annual deliveries from current production for a period to be decided upon and German labour. The sum total for the first two classes of reparations suggested by the U.S.S.R. as a provisional basis for future discussions was set at \$20,000,000,000, half of which was to go to the U.S.S.R. Great Britain dissented, suggesting that no figure be set in advance of discussions to be held at Moscow. An agreement was also reached whereby the U.S.S.R. was to enter the war against Japan within two or three months of the German surrender. Chief among the conditions for

The International Conference at Berlin (Potsdam) was resumed on July 28, 1945, after results of the British elections were announced. Prime Minister Attlee is at far side of table, centre; Marshal Stalin stands at right; President Truman is in left foreground

such participation were (1) the cession to the U.S.S.R. of the Kurile Islands and the southern part of Sakhalin as well as adjacent islands, (2) internationalization of the port of Dairen, (3) restoration to the U.S.S.R. of the lease of Port Arthur as a naval base and (4) joint soviet-Chinese operation of the Chinese-Eastern railroad forming an outlet to the port of Dairen.

Egypt Conference.—Following the Crimea conference President Roosevelt proceeded to Egypt, where he conferred with King Farouk of Egypt, Emperor Haile Selassie of Ethiopia and King Ibn Saud of Saudi Arabia, to cement Allied relations with these powers and reach an understanding on matters of supply and maintenance of shipping routes.

United Nations Conference on International Organization.—For a discussion of this conference, popularly known as the "San Francisco conference" (April 25-June 26, 1945), see United Nations.

Berlin-Potsdam Conference, also called the Tripartite Conference of Berlin.-On July 17, 1945, President Harry S. Truman, Prime Minister Churchill, Clement R. Attlee and Generalissimo Stalin met near Potsdam, a suburb of Berlin. Nine meetings were held between this date and July 25, when they were temporarily adjourned during the British elections. On July 28 Attlee rejoined the conference as successor to Churchill, and discussions were resumed. The members agreed on the establishment of a council of foreign ministers to represent the five principal powers in the preparation of peace treaties and settlements with Italy, Rumania, Bulgaria, Hungary, Finland and Germany; they decided on a plan of exacting reparations from Germany and of governing that country. Further considerations dealt with the disposal of the German navy and merchant marine, treatment of war criminals, the extension of authority of existing provisional Austrian and Polish governments.

Following is the text of the Potsdam agreement:

A. Political Principles.

1. In accordance with the agreement on control machinery in Germany, supreme authority in Germany is exercised on instructions from their respective governments, by the Com-

manders-in-Chief of the armed forces of the United States of America, the United Kingdom, the Union of Soviet Socialist Republics, and the French Republic, each in his own zone of occupation, and also jointly, in matters affecting Germany as a whole, in their capacity as members of the Control Council.

2. So far as is practicable, there shall be uniformity of treat-

ment of the German population throughout Germany.
3. The purposes of the occupation of Germany by which the Control Council shall be guided are:

(i) The complete disarmament and demilitarization of Germany and the elimination or control of all German industry that could be used for military production. To these ends:

(a) All German land, naval and air forces, the S.S., S.A., S.D., and Gestapo, with all their organizations, staffs and in-stitutions, including the General Staff, the Officers' Corps, Reserve Corps, military schools, war veterans' organizations and all other military and quasi-military organizations, together with all clubs and associations which serve to keep alive the military tradition in Germany, shall be completely and finally abolished in such manner as permanently to prevent the revival or reorganization of German militarism and Naziism.

(b) All arms, ammunition and implements of war and all specialized facilities for their production shall be held at the disposal of the Allies or destroyed. The maintenance and production of all aircraft and all arms, ammunition and imple-

ments of war shall be prevented.

(ii) To convince the German people that they have suffered a total military defeat and that they cannot escape responsibility for what they have brought upon themselves, since their own ruthless warfare and the fanatical Nazi resistance have destroyed German economy and made chaos and suffering inevitable.

(iii) To destroy the National Socialist Party and its affiliated and supervised organizations, to dissolve all Nazi institutions, to ensure that they are not revived in any form, and to prevent all Nazi and militarist activity of propaganda.

(iv) To prepare for the eventual reconstruction of German political life on a democratic basis and for eventual peaceful

co-operation in international life by Germany.

4. All Nazi laws which provided the basis of the Hitler regime or established discrimination on grounds of race, creed, or political opinion shall be abolished. No such discriminations, whether legal, administrative or otherwise, shall be tolerated.

5. War criminals and those who have participated in planning or carrying out Nazi enterprises involving or resulting in atroctities or war crimes shall be arrested and brought to judg-ment. Nazi leaders, influential Nazi supporters and high officials of Nazi organizations and institutions and any other persons dangerous to the occupation or its objectives shall be arrested and interned.

6. All members of the Nazi party who have been more than nominal participants in its activities and all other persons hostile to allied purposes shall be removed from public and semi-public office, and from positions of responsibility in important private undertakings. Such persons shall be replaced by persons who, by their political and moral qualities, are deemed capable of assisting in developing genuine democratic institutions in Germany.

7. German education shall be so controlled as completely to eliminate Nazi and militarist doctrines and to make possible

the successful development of democratic ideas.

8. The judicial system will be reorganized in accordance. with the principles of democracy, of justice under law, and of equal rights for all citizens without distinction of race, nationality or religion.

9. The administration of affairs in Germany should be directed towards the decentralization of the political structure and the development of local responsibility. To this end:

(i) Local self-government shall be restored throughout Germany on democratic principles and in particular through elective councils as rapidly as is consistent with military security

and the purposes of military occupation;

(ii) All democratic political parties with rights of assembly and of public discussion shall be allowed and encouraged

throughout Germany;

(iii) Representative and elective principles shall be introduced into regional, provincial and state (land) administration as rapidly as may be justified by the successful application of these principles in local self-government;

(iv) For the time being no central German government shall be established. Notwithstanding this, however, certain essential central German administrative departments, headed by state secretaries, shall be established, particularly in the fields of finance, transport, communications, foreign trade and industry. Such departments will act under the direction of the Control Council.

10. Subject to the necessity for maintaining military security, freedom of speech, press and religion shall be permitted, and religious institutions shall be respected. Subject likewise to the maintenance of military security, the formation of free trade unions shall be permitted.

B. Economic Principles.

11. In order to eliminate Germany's war potential, the production of arms, ammunition and implements of war as well as all types of aircraft and sea-going ships shall be prohibited and prevented. Production of metals, chemicals, machinery and other items that are directly necessary to a war economy shall be rigidly controlled and restricted to Germany's approved post-war peacetime needs to meet the objectives stated in paragraph 15. Productive capacity not needed for permitted production shall be removed in accordance with the reparations plan recommended by the Allied Commission on reparations and approved by the governments concerned or if not removed shall be destroyed.

12. At the earliest practicable date, the German economy shall be decentralized for the purpose of eliminating the present excessive concentration of economic power as exemplified in particular by cartels, syndicates, trusts and other monopo-

listic arrangements.

13. In organizing the German economy, primary emphasis shall be given to the development of agriculture and peaceful domestic industries.

14. During the period of occupation Germany shall be treated as a single economic unit. To this end common policies shall be established in regard to:

(a) Mining and industrial production and allocations; (b) Agriculture, forestry and fishing;

(c) Wages, prices and nationing;

(d) Import and export programs for Germany as a whole; (e) Currency and banking, central taxation and customs; (f) Reparation and removal of industrial war potential;

(g) Transportation and communications.

In applying these policies account shall be taken, where appropriate, of varying local conditions.

15. Allied controls shall be imposed upon the German econ-

omy but only to the extent necessary:

(a) To carry out programs of industrial disarmament and demilitarization, of reparations, and of approved exports and

imports.

(b) To assure the production and maintenance of goods and services required to meet the needs of the occupying forces and displaced persons in Germany and essential to maintain in Germany average living standards not exceeding the average of the standards of living of European countries. (European countries means all European countries excluding the United Kingdom and the Union of Soviet Socialist Republics.

(c) To ensure in the manner determined by the Control Council the equitable distribution of essential commodities between the several zones so as to produce a balanced economy throughout Germany and reduce the need for imports.

(d) To control German industry and all economic and financial international transactions, including exports and imports, with the aim of preventing Germany from developing a war potential and of achieving the other objectives named herein.

(e) To control all German public or private scientific bodies, research and experimental institutions, laboratories, et cetera,

connected with economic activities.

- 16. In the imposition and maintenance of economic controls established by the Control Council, German administrative machinery shall be created and the German authorities shall be required to the fullest extent practicable to proclaim and assume administration of such controls. Thus it should be brought home to the German people that the responsibility for the administration of such controls and any breakdown in these controls will rest with themselves. Any German controls which may run counter to the objectives of occupation will be prohibited.

 - 17. Measures shall be promptly taken:(a) To effect essential repair of transport;

(b) To enlarge coal production;

To maximize agricultural output; and

- (d) To effect emergency repair of housing and essential ntilities.
- 18. Appropriate steps shall be taken by the Control Council

to exercise control and the power of disposition over Germanowned external assets not already under the control of United Nations which have taken part in the war against Germany.

19. Payment of reparations should leave enough resources to enable the German people to subsist without external assistance. In working out the economic balance of Germany the necessary means must be provided to pay for imports approved by the Control Council in Germany. The proceeds of exports from current production and stocks shall be available in the first place for payment for such imports.

first place for payment for such imports.

The above clause will not apply to the equipment and products referred to in paragraphs 4 (A) and 4 (B) of the Reparations Agreement. [The latter paragraphs referred to two secret provisions for soviet reparations claims in the western

zones of occupation, as outlined below.-ED.]

Two other important matters were considered in secret and not made public until March 1947. The first was a declaration that the Montreux convention was out-of-date and recommended for revision to the foreign ministers of the Big Three. The second concerned revision of the plan for German reparations as discussed at Yalta. Chief among the new terms were the agreements that (1) soviet reparation claims were to be met from the soviet zone of occupation except as noted below (all other claims were to be met from the western zones and external German assets); (2) the U.S.S.R. agreed to settle Polish claims from its own share of reparations; (3) in addition to reparations taken by the U.S.S.R. from its own zone of occupation, it was to receive (a) 15% of such industrial capital equipment as could be taken from the western zones of Germany without unbalancing the German economy, in exchange for foodstuffs, fuels and minerals, and (b) 10% of such industrial capital equipment as could be taken from the western zones without unbalancing the German economy, for which no payment was to be made. Such removals from the western zones were to be completed within two and one-half years and exchange deliveries covered by 3(a), within five years.

International Court of Justice

The International Court of Justice, created by the United Nations, had as a heritage the experience and traditions of the Permanent Court of International Justice (q.v.), created by the League of Nations. The paragraphs that follow summarize the high points of its immediate historical background and initial session.

Dumbarton Oaks Proposals.—The Dumbarton Oaks Proposals of 1944 for the establishment of a general international organization envisaged a court as a part of the organization. They stated that there should be such a Court; that its statute should be (a) the statute of the Permanent Court of International Justice, continued in force with such modifications as might be desirable or (b) a new statute in the preparation of which the statute

of the Permanent Court of International Justice should be used as a basis.

Committee of Jurists.—In April 1945, a conference of jurists representing 44 United Nations was held in Washington, D.C., to prepare a draft statute to be considered at the then forthcoming San Francisco conference. The draft thus prepared followed in the main the statute of the Permanent Court of International Justice with modifications needed to harmonize it with the new international organization then in prospect. Certain improvements over the old statute were incorporated. Questions whether a new court should be created or the old one continued, whether the judges should be nominated directly by the governments and whether compulsory jurisdiction should be optional or mandatory, were left for consideration at San Francisco, being largely political in character.

The draft prepared by the committee of jurists formed the bases of discussion at San Francisco and with such changes as were there made became the statute of the new court, the International Court of Justice.

United Nations Charter.—By article 7 of the charter of the United Nations, the court was made one of the principal organs of the United Nations, and by article 92 it was denominated "the principal judicial organ" and the statute was made an annex to, and an integral part of the charter. All members of the United Nations ipso facto became parties to the statute.

The conditions under which other states might adhere to it were left to be determined in each case by the general assembly upon recommendation of the security council (article 93).

Court Statute.—The statute under which the court functions consists of seventy articles, covering such subjects as organization, competence, procedure, advisory opinions and amendments.

The 15 judges are elected by the general assembly and the security council, independently, from nominations submitted by the national groups in the Permanent Court of Arbitration (Hague Convention I, 1899 and 1907) or by national groups appointed for this purpose by states not represented in the court of arbitration (article 4). The term of office is nine years, but it was provided that of those chosen at the first election the terms of five should expire at the end of three years and those of five others at the end of six years (article 13). This makes it possible to have on the court at all times a majority of experienced judges.

The seat of the court is at The Hague, but it may function elsewhere if it considers it desirable (article 22).

Competence.—Only states may be parties to cases before the court (article 34). States not parties to the statute may have access to the court on conditions determined by the security council (article 35). No state may be sued without its consent unless it has accepted compulsory jurisdiction of the court under article 36 of the statute, and then only with respect to specified classes of cases. Such acceptances may be unconditional or on condition of reciprocity. As between parties to the statute, states which had accepted compulsory jurisdiction of the old court automatically accepted compulsory jurisdiction of the new court for the unexpired period of such acceptances (article 36, paragraph 5).

The court decides cases in accordance with international law. It applies international conventions, international custom (as evidence of a general practice accepted as law), the general principles of law recognized by civilized nations, and it may look to judicial decisions and the teachings of highly qualified publicists, as subsidiary means

for determining rules of law. It may decide cases ex aequo et bono, it the parties agree (article 38).

Procedure.-The official languages of the court are French and English (article 39). Parties to cases are represented by agents. They may have assistance of counsel or advocates before the court (article 42). The procedure consists of written pleadings and oral arguments. Witnesses and experts may be heard (article 43). Decisions are given by a majority of the judges present but judges not concurring may write separate opinions (articles 55-57).

Advisory Opinions, Amendments.—The Court may give advisory opinions on legal questions at the request of the general assembly or the security council. Other organs and specialized agencies of the United Nations may request such opinions on legal matters within the scope of their activities if authorized by the general assembly (articles 65-69, statute; article 96, charter).

The procedure of amending the charter applies to the statute (article 69). The court may propose amendments (article 70).

First Election.—The first election of judges took place on Feb. 6, 1946, at the London meeting of the General Assembly and the Security Council, and the court held its first session at The Hague, April 3-May 6, 1946.

(G. H. H.)

The 15 judges elected and their terms of office were as fol-

Name	Nation	Term of office (years
Dr. Hsu Mo	China	Three
Dr. C. de Visscher	Belgium	Six
Prof. J. Basdevant	France	Nine
Dr. J. G. Guerrero*	El Salvador	Nine
Sir Arnold McNair,		
К. С.	United Kingdom	Nine
Prof. S. G. Krylov	U.S.S.R.	Six
Sr. Fabela Alfaro	Mexico	Six
Green H. Hackworth	United States	Six
Dr. A. Alvarez	Chile	Nine

International Labour Conference

See International Labour Organization.

International Labour Organization

The decade 1937-46 began with three prosperous years during which the 23rd (1937), 24th (1938) and 25th (1939) sessions of the International Labour conference were held in Geneva. More than 50 member states were represented in 1939 by 86 government, 34 employer and 84 worker delegates, who with their advisers and others made a total of 362 participants. Four lean years followed, with only one conference (the extraordinary session held in New York and Washington in 1941 at which 34

member states were represented). Finally there were three years of expansion, during which four conferences met: the 26th session in Philadelphia, April 20-May 12, 1944, 27th in Paris, Oct. 1945, 28th (Maritime) in Seattle, June 9-29, 1946, and the 29th, Montreal, Sept. 19-Oct. 9, 1946, with 159 delegates, 241 advisers and others making a total of 429 participants, representing 46 member states.

These years witnessed continuous growth, increased faith in the fundamental principles and soundness of the structure of I.L.O. and confidence in its unique pioneering experience and accumulated experience of years. It had demonstrated, as about the only international "going concern," the value of the tripartite system of representation, its concern for the common interests of everyday life and the administrative initiative and responsibility of its director. (Cf. Carter Goodrich, Annals, v. 246.)

The Conventions (Treaties) 1937-46.—Prepared by experts with meticulous care after consultation with governments and debated usually in two or more consecutive conferences, the conventions were adopted by two-thirds vote, as follows:

1937 (23rd Session, Geneva) No. 59, Minimum Age (Industry), Revised; No. 60, Minimum Age (Non-industrial Employment), Revised; No. 61, Reduction of the Hours of Work (textiles); No. 62, Safety Provisions (Building).

1938 (24th Session, Geneva) No. 63, Statistics of Wages and Hours of Work.

1939 (25th Session, Geneva) No. 64, Contracts of Employment (Indigenous Workers); No. 65, Penal Sanctions (Indigenous Workers); No. 66, Migration for Employment; No. 67, Hours of Work and Rest Periods (Road Transport).

1946 (28th Session, Maritime, Seattle, Wash.) No. 68, Food and Catering for Crews on Board Ship; No. 69, Certificaand Catering for Crews on Board Ship; No. 69, Certification of Ships' Cooks; No. 70, Medical Examination of Seafarers; No. 71, Vacation Holidays with Pay for Seafarers; No. 72, Crew Accommodation on Board Ship; No. 73, Social Security for Seafarers; No. 74, Certification of Able Seamen; No. 75, Seafarers' Pensions; No. 76, Wages, Hours of Work on Board Ship, and Manning. Yang Session, Montreal) No. 77, Medical Examination Young Persons (Industry); No. 78, Medical Examination Young Persons (Non-industrial occupations); No. 79, Night Work Young Persons (Non-ind. occupations); No. 80. Eind Articles Portion convention 80, Final Articles Revision convention.

Recommendations followed the same procedure as conventions and dealt with subjects not yet ripe for a convention, or for better enforcement and clarification of existing conventions. Seven were adopted in 1937, 10 in 1939, 7 in 1944, 1 in 1945, 4 at the 28th (maritime) session in 1946 and 2 at the 29th session in 1946—a total of 80 after 1919. The conventions adopted, 1919-46, numbered 80, of which 52 were in force in 1946. Two acts of historic importance that transcended all the conventions and recommendations were: (1) the Declaration of Philadelphia-1944, concerning the aims and purposes of the I.L.O., reaffirmed the original charter and expanded its interpretation and intent to include matters pertaining to the close relationship between labour and general economic policy; (2) two instruments for the amendment of the I.L.O. constitution: 1945, Paris, dealt with membership, finance and procedure for future amendments, later ratified.

Ratifications and Enforcement.-Of 922 ratifications of conventions, registered 1919-46, 19 occurred in 1945-46, and 37 during the war years, 1939-45. Enforcement depended on mutual supervision through annual reports required by the constitution of member states on the action taken on ratified conventions. Such reports in the years 1937-39 and 1945-46 were submitted to a committee of experts for examination and report to the next conference, where they were again examined by the Con-

ference Committee on Application of Conventions, and fully debated in the conference itself. Of 725 reports requested for the 29th session in 1946, 523 were received which under existing world conditions demonstrated satisfactory efforts of member states to fulfil their obligations.

Special Conferences and Committees.—First in order of importance were the 2nd and 3rd Regional Conferences of American States (I.L.O. members) in Havana, Cuba, 1939, and Mexico City, 1946, which reaffirmed American solidarity and the value of I.L.O. principles as a defense of freedom and democracy. The First Inter-American Social Security conference was held at Santiago, Chile, in 1942, and the Permanent committee, organized in 1940 under joint auspices of Peru and the I.L.O., met in Mexico City in 1945 and the executive committee in Geneva in 1946 to arrange for the 2nd I.A.S.S. conference. The Joint Maritime commission held two meetings in London in 1942 and 1945; the Maritime Technical Preparatory conference met in Copenhagen in Nov. 1945, and preparations were completed for the very successful 28th (Maritime) Session of the General Conference. International tripartite industrial committees were a new departure in I.L.O. technique, authorized by the Philadelphia conference, 1944. The Coal Mines, and Inland Transport committees held their first meetings in London in Dec. 1945, Iron and Steel in Cleveland and Metal Trades in Toledo, O., in April and May 1946.1

Other I.L.O. Services.-High staff officials attended numerous meetings on invitation of other international organizations, and thus made substantial contributions from I.L.O. experience to solution of other international problems. Meetings like those on urgent food problems of the Food and Agriculture organization (U.N.), in Washington, D.C., May 1946, on economic reconstruction of devastated areas, and the Preparatory commission of U.N.E.S.C.O., both in London in July 1946, increased the burdens and opportunities of I.L.O. Missions of high officials to many countries were made for first-hand information and renewal of contacts, such as the re-establishment of correspondents in Prague and Warsaw, and the reopening of the Rome branch in 1946.2

Publications.—Of chief importance were: International Labour Code, 1919-39, 920 pp. (Montreal, 1941); Constitutional Provisions Concerning Social and Economic Policy, 755 pp. (1944); Inter-American Handbook of Social Insurance Institutions, 1945, 187 pp.; the Director's Reports; Proceedings of the Conferences; Conference Documents;3 International Labour Review (monthly), and Legislative Series (quarterly).4

A few of the more important committee meetings held in 1945 and 1946 were: the Correspondence Committee on Accident Prevention, to draft a Model Code of safety regulations for factories, Montreal, Nov. 1945; International Development Works, Montreal, Jan. 1946; Employment, May, Women's Work, July, Permanent Migration, August, all in Montreal; and Experts on the application of conventions (16th Session), Montreal, July 1946. Proceedings and action taken by most committees reported fully in subsequent issues of *International Labour Renew*.

I.L.O. and the United Nations.-The I.L.O. conference in Geneva in 1939 declared it would maintain its activities to the greatest possible extent in the event of war. Director John G. Winant found this impossible in Geneva in 1940 and established temporary headquarters in Canada under an emergency committee authorized to act for the governing body when it could not meet. In Montreal, less than 50 staff members (about 10% of prewar staff) began operations. A few remained in Geneva to guard the home plant, the books and archives that could not be taken along; others went to London, Washington and India to strengthen local branches; some were sent on special missions, others were pensioned, resigned or dismissed. The extraordinary conference (New York-Washington, 1941) voted unanimously to support and continue the experiment, and pledged its loyalty to the allied cause as the only hope of a world in which I.L.O. principles and social objectives could be realized. The declaration of Philadelphia, adopted unanimously at the 26th session of the conference (1944) and added to the constitution by amendment in 1946, reaffirmed the "principles" and included economic functions necessary for the achievement of the "social objective." A new I.L.O. was born in Philadelphia, pledged to co-operate with the United Nations and all international agencies to make its experience and resources available for reconstruction and world peace.

The Paris conference in 1945 (27th session) adopted an instrument of amendment, duly ratified in 1946, which amended the constitution with respect to membership, finances and adoption of future amendments. It severed its connection with the League of Nations, and set up a delegation on constitutional questions to report further amendments necessary for complete co-operation with the United Nations and the Social and Economic council. In May 1946, a draft agreement was negotiated between the U.N. and I.L.O. which made I.L.O. a "specialized agency" of the U.N. for appropriate action in its special field, and established a working partnership of autonomous equals for their mutual advantage. It was ratified by all parties in interest.⁵ (See also Child Welfare; League of Nations; WORLD FEDERATION OF TRADE UNIONS.) (S. McC. L.)

International Law

It is difficult for the human mind to contemplate the fundamental changes that took place in the ten years 1937-46. From the period when both municipal law and international law were at least designed to save human values, the world had come to the period of the atomic bomb and the United Nations with veto powers which practically excluded the rule of law in time of war. From a policy of nonintervention as dictated by international law, the nations had come to the mores of universal inter-

tion of conventions (10th Session), 1200 taken by most committees reported fully in subsequent issues of International Labour Review.

2 Often missions were sent at request of governments for help in adjusting national legislation and administration in order to ratify conventions or fulfil obligations already incurred. The Chinese government requested, in 1946, technical assistance in connection with employment problems, labour inspection and social insurance. Written inquiries, not requiring missions, were numerous and exacting in research, collection and classification of material in LLO. files, and sometimes they entailed correspondence with other member-states. A few in 1946 were those of Egypt for a pension scheme for industry; India for a social insurance scheme for Indian seafarers; Iran for a draft safety code; Nicaragua for criticism of a draft labour code; Norway for holidays-with-pay regulations; Sweden for information on work in compressed air.

3 Thirty-five Conference Documents, most in 3 languages, aggregating 10,000 words, were published in 12 months in 1945-46. Many contained valuable technical information on major world problems, some of considerable historical value.

4 Other serials extensively relied upon for factual material not otherwise accessible were: Industral Safety Survey, quarterly; Year Book of Labour Statistics, annual, and the Official Bullatin, at irregular intervals. All the serials were maintained throughout the decade under review (1937-46).

⁵ The director of the International Labour Office, Edward J. Phelan, was appointed director Sept. 16, 1946, effective retroactively from Feb. 1941, when he was made acting director to succeed John G. Winant, resigned. The salary of the director was 80,000 Swiss francs per annum with an annual entertainment allowance of 20,000 Swiss francs, a total of approximately \$25,000. The new fourth director deserved the high honour conferred upon him as the successor of Albert Thomas, Harold Butler and John G. Winant. Phelan was one of the "founding fathers" in Paris in 1919, was appointed to high office in the I.L.O. by the first director, and had been in its service continuously through its 27 years. With remarkable skill, courage and statesmanship he piloted the organization through six troublesome years, 1941–1946, and brought it back to near prewar strength.

vention in the ostensible interest of keeping the peace, but with results which could hardly eventuate in peace. From a relatively legal regime, nations had come down to a period of confusion that made the life of small states exceedingly precarious. From a system of co-ordination, which assumed the legal equality of states, on which international law was founded, an effort had been made to produce a system of subordination, analogous to municipal law, by which the major states would assume responsibility by force to maintain peace among the smaller states. This was capped by the atomic bomb which, unless controlled as no other lethal weapon had ever been controlled, bore the potentialities of world-wide destruction. No such dilemma had ever faced civilized man.

One might attribute this degradation to numerous causes, but critics believed not least among them was the change in U.S. policy from abstention from European and Asiatic wars to a policy of allegedly utilitarian intervention in the interest of righteousness. Some critics maintained that the United States at the end of World War II was so deeply bogged in Europe and in Asia that the future of the country was doubtful.

The new U.S. foreign policy was supposed to be in execution of newly-discovered "responsibilities" of the United States by sanctions and war to keep the world peaceful and bring about changes by "orderly processes."

The new method of running the world by organizing the so-called peace-loving nations against the "aggressor"—meaning any disfavoured country—was totally inconsistent with the law and with the development of history. It was glib and facile to announce the propaganda that this was "one world." Like many half-truths this was likely to be believed by some, especially in the face of the atomic bomb.

But climates differ in various parts of the globe, peoples differ and nationalism showed no sign of surrender. So long as such conditions prevailed, examination was likely to disclose, if not many worlds, many nations.

Neutrality vs. Intervention.—Although in the period between 1928 and 1935 there had been a strong movement in the United States to grant the president discretion in place of law, it was not until the "quarantine" speech of Oct. 1937, that President Franklin D. Roosevelt really disclosed his ambitions to discriminate between belligerents, to join in foreign wars, to "quarantine" the "aggressor" and to exert sanctions to accomplish that end. He believed that it was possible, without upsetting the world, to make an expanding country subservient to the wishes of the self-satisfied.

The year 1937 was also important because it witnessed a revision of the U.S. Neutrality act of 1935; it witnessed the passing of the Act of Jan. 8, 1937, in which the restrictions of that Neutrality act were applied to the Spanish Civil War; and it witnessed the attack of Japan on China at Peiping, which led to U.S. intervention in the war against Japan.

In the matter of U.S. neutrality, Senator Gerald Nye and his friends, desiring to avoid some of the temptations which led to U.S. involvement in World War I, had succeeded in obtaining the enactment of a strong statute known as the Neutrality act, which went beyond the obligations of the United States under international law. Among other matters it prohibited the export of arms, ammunition and implements of war, prohibited loans to belligerents, prohibited American vessels from entering war zones, prohibited the arming of merchant vessels and required that any commodities other than arms, ammunition and implements of war be carried away in foreign ships

after title had passed to a foreign national prior to leaving a U.S. port. There was some evidence that President Roosevelt signed this bill with great reluctance, for he had wanted from the beginning a presidential discretion in distinguishing between what he called the good and evil belligerents in the interests of righteousness. He was irked by the injunction of maintaining an impartial position between two foreign belligerents, but yielded to the pressure of public opinion and extolled the virtues of U.S. neutrality and abstention from foreign wars.

In the face of this record it was a feat of no mean proportions to confuse the public in 1939 into a belief that an arms embargo was immoral and that the lifting of the arms embargo with the shipment of arms, practically to one side only, was a virtue. Even greater was the change permitting U.S. ships to enter war zones and lifting the restrictions on arming merchant ships. While loans to belligerents were still prohibited, the lending powers of the Export-Import bank were increased so that government loans replaced private loans. At the same time irritating embargoes were placed upon Japan, and the commercial treaty with that country was abrogated. These were all justified as "measures short of war," designed to keep the United States out of war. At the same time Secretary Cordell Hull made continuous attacks on isolation as a method of getting the country into war and praising intervention as a method of keeping it out.

The result was foreshadowed. While paying lip service to the demands of the U.S. people to keep out of war, in speeches throughout the period ending with the campaign of 1940, the acts that were actually undertaken were calculated to drive the country into war. This became especially pronounced after the fall of France in June 1940, which deeply shocked the president. It is hard to read the negotiations with Japan of 1941 without realizing that peace was not in prospect.

The last vestiges of the Neutrality act disappeared on Dec. 7, 1941, when Japan attacked Pearl Harbor and initiated the war. Shortly thereafter Germany and Italy declared war upon the United States.

Spanish Civil War.—On Jan. 9, 1937, the U.S. congress placed an arms embargo on both parties to the Spanish Civil War which began in 1936. The United States followed in the footsteps of the League of Nations and the Nonintervention committee in London and thereby actually helped to defeat the loyalists. Francisco Franco was not then a recognized belligerent, and the United States was under a legal duty to trade only with the Spanish loyalists. Yet the executive refused to admit the existence of a war in Spain, an admission which would have entailed recognition of both parties to the war as belligerents and hence entitled to exercise belligerent rights on land and at sea. By the embargo, nevertheless, the administration implicitly admitted that there were two parties to the war, and that the rules of neutrality and nonintervention required that both parties be treated impartially. This was an anomalous position, and when in 1938 the United States tried to withdraw, it was found that a vested interest in that position had grown and the Franco regime had acquired greater strength, so as to entitle it to recognition as a belligerent. The loyalists being deprived of the arms to which they had a right, the result was that Franco, with the aid of Benito Mussolini and Adolf Hitler, succeeded in defeating the loyalists, who had slight aid from Russia. Some people regarded the Spanish Civil War as a testing ground for the subsequent world war. Franco was ulti-

mately recognized by the Nonintervention committee and by the United States.

A curious situation developed with respect to the requisition abroad of Spanish vessels. Before the end, two governments were actually recognized by foreign courts as functioning in Spain. If the vessel came from territory controlled by Franco, he alone was sustained in requisitioning it. If the vessel came from territory controlled by the loyalists, only the loyalist government could function. This gave rise to serious criticism. (See also Spanish Civil War.)

Chinese-Japanese War.—The background of the Chinese-Japanese War was wrapped in confusion. Japan had acquired the status of a great power only in recent years. The disorganization of China and the incessant wars in that country had led to a state of anarchy which invited intervention. Had China been a strong nation the intervention would hardly have occurred. President Roosevelt never "found" that the Chinese-Japanese conflict was "war" because he would have had to invoke the Neutrality act and would have been unable to help the Chinese government as he actually did. Japan also had its reasons for not declaring war, although as the British court recognized, war actually existed.

Later in the year, in his "quarantine" speech, President Roosevelt charged that Japan was a treaty-breaker, having violated the League covenant, to which the United States was not a party, the Kellogg-Briand pact, which contained stultifying reservations, and the Nine Power treaty, which was a political document incapable of legal exegesis. From that moment, however, he determined that Japan was an "aggressor," and that it was the United States' duty to stop Japan. The conversations of 1941 between Japan and the United States showed clearly the diametrically opposed views of policy and came to an impasse on Nov. 26, 1941, when Secretary Hull handed Japan certain conditions which he knew Japan could not or would not accept. Japan had overrun a large part of China and apparently was unprepared to withdraw at U.S. command. It risked war rather than fulfil the United States' requirements.

Aid to the Allies.-During 1940 and 1941 the administration performed numerous acts not permitted to a neutral nation under the law of neutrality. It cannot be said, however, that the people of the United States were unwilling to help England in this way. The United States permitted bombing planes to be supplied to Great Britain and France. To avoid conflict with U.S. statutes, they were flown from California to the Canadian border by U.S. pilots, title there transferred, and the flight then continued across Canada to England. England built many powder and munition plants in the United States. Cotton and rubber were supplied to England by virtue of an agreement made June 23, 1939. England freely examined the mails that went from the United States to Germany, under an admission made in May 1916. The claim that belligerent acts could not be committed in an immunity zone 300 to 600 mi. around the American continent, promulgated at Panama in 1939, was disregarded by the belligerents without protest. Damaged British ships were repaired in U.S. shipyards. The destroyer deal of Sept. 1940, transferred 50 over-age destroyers to Great Britain. Under the Lend-Lease act of March 11, 1941, some \$49,000,000,-000 of lend-lease (q.v.) materials were supplied to the belligerents and other countries whose defense was deemed by the President important to the defense of the United States, thus enabling the President to choose United States allies and United States enemies at discretion. The naval bases were insured by U.S. possession against enemy attack German submarines were hunted down by U.S. destroyers within the 300 or 600 mi. zone, regardless of the fact that no belligerent accepted this excessive claim. The "Reuben James," a U.S. destroyer, was actually sunk in this enterprise. The numerous provocative acts against Japan, such as the declaration of a moral embargo, followed by a legal embargo and the abrogation of the commercial treaty with Japan, were within U.S. legal rights. They doubtless created the expected resentment.

Black Lists and Prize Law.—After the attack on Pearl Harbor the United States officially entered the war and helped to determine its outcome. After Germany overran numerous other countries in Europe the funds of nationals of those countries in the United States were frozen and black lists of neutral traders based upon their supposed sympathy with the nazi cause were published from time to time. The black lists were designed to prevent U.S. citizens from trading with persons on the list and helped largely to bring about their ruin or damage. The list was not immediately abrogated after the war, so that it became also a post-war measure for restricting trade, punitive in purpose and character.

Prize law was largely set aside in the United States; no important prize case had occurred since the Spanish American War about 50 years before. There were some English cases on prize law. Judge Boyd Merriman applied the rules decreed by the Prize Act of 1939, and the precedents of World War I.

Potsdam Declaration.—In the Potsdam declaration of Aug. 1945, the obligations of law seem to have vanished. Under the guise of reparations the distinction between private property and public property was wiped out, territory was amputated without regard to the will of the inhabitants, mass migrations were commanded, the Geneva Convention on Prisoners of War was disregarded by the resuscitation of the institution of "slave labour" and the vanquished powers were more or less eradicated from participation in world trade. President Harry S. Truman admitted that chaos had been created in Germany, but this he attributed to the nazi regime.

A few further words should be said about the Potsdam declaration, since this was the basis on which some of the peace treaties were to be drawn. The declaration seemed to regard law as one of the forgotten virtues. It was hard to say which violation embodied the most future danger, but it was certain that the confiscation of private property which it directed if it did not command, had in it the seeds of great damage to the western system. If private property was to be confiscated on a large scale, the end of that institution might be foreshadowed. Trade would be greatly impaired and foreign investment rare. The capitalistic system was founded on the sanctity of private property; to destroy that foundation was to impair the institution built upon it.

(See also International Conferences, Allied [World War II.])

Treaties and Executive Agreements.—The Litvinov assignment of Russian assets to President Roosevelt for the United States in 1933 gave rise to several cases of great importance. In 1936 Justice George Sutherland, in the case of United States v. Curtiss-Wright Export Corp. (a criminal prosecution for violating the presidential embargo on the shipment of arms to Paraguay and Bolivia in the Chaco War), uttered a dictum declaring a wide power over foreign affairs possessed by the federal government, given to it as direct successors to the crown outside the constitu-

tion, though the agents of the government seemed to be bound by the constitution. This was followed in 1937 by the case of United States v. Belmont, coming up on a motion to dismiss the claim of the United States, as successor to the soviets, to private assets held in a U.S. bank for Russian creditors. There also Justice Sutherland pronounced a dictum to the effect that the soviets had successfully confiscated debts due by U.S. citizens to Russian creditors. This dictum was used in the later case of United States v. Pink, officially to support the thesis that the United States had obtained title to the surplus held by the New York superintendent of insurance after the liquidation of the first Russian Insurance company, and that the United States title took priority over the claims of Russian stockholders and creditors. This decision not only purported to justify extraterritorial confiscations but had the curious effect of confiscating only a certain type of Russian property, debts due by U.S. citizens to Russian nationals; gave the imprimatur of validity to Russian confiscations of property in the United States, whereas the state department was contending that Russian confiscations in Russia were invalid; in effect traded about \$5,000,000 of this type of asset for claims against Russia of approximately \$300,-000,000, which doubtless never would be paid; permitted the President alone by executive agreement to change title to U.S. property, and threw the legal profession into consternation. Chief Justice Harlan Stone and Justice Owen Roberts dissented violently from the majority decision, which purported to legalize the Roosevelt-Litvinov executive agreement, and since it was incidental to recognition, was deemed to prevail over New York policy and law. The New York courts gave the decision a strict interpretation and applied it only to confiscations of which the United States became the beneficiary.

These decisions were employed to great advantage in the unremitting campaign to deprive the senate of its two-thirds vote on treaties. This campaign encountered numerous vicissitudes. Following are the statistics which indicated the submergence of the treaty and the prevalence of the executive agreement, which might or might not be submitted to congress for its consideration:

Year of Official Printing	Treaties	E \ccutive A greements
1930	25	11
1931	13	14
1932	11	16
1933	9	11
1934	14	16
1935	25 8	10 ′
1936	8	16
1937	15	10
1938	12"	24
1939	10	26
1940	12	20
1941	15 6	39
1942	6	52
1943	4	71
1944	1	74
1945	5	56

The campaign began with the publication of Wallace McClure's book on executive agreements. He therein undertook to contend that anything that could be accomplished by treaty could be accomplished by executive agreement, without congress if possible, with congress if necessary. During the war the United Nations Relief and Rehabilitation administration, the Bretton Woods Agreements act, the Food and Agriculture organization and numerous other statutes had been passed, which indicated a practical waiver by the senate of its insistence upon a treaty. When the substance of the tentative executive agreement was included in the bill or joint resolution to

be passed, and was not signed as a final agreement until congress acted, it might be deemed to have been "authorized" by congress. The campaign reached its climax in the matter of the St. Lawrence Waterway and Power project, a resolution designed to endorse an executive agreement of 1941, in the hearings on which it was officially contended that when an agreement dealt with a subject matter within the power of congress, the executive might turn a prior treaty into an executive agreement, send the agreement to congress for its "information" and there solicit the approval of a majority of house and senate. This procedure was endorsed by those senators favouring the St. Lawrence project. It would serve to give the president an option whether to submit his treaty to the senate, which he would do when assured of a vast majority, or to label his treaty an executive agreement and submit it only to a bare majority, like a statute. In May 1945, a proposed constitutional amendment was debated and passed by the house in a form permitting the participation of the house in treatymaking but requiring 218 in the house and 49 in the senate as a condition of the approval of treaties. The proposed amendment rested in the senate judiciary committee with 2,000 other proposed amendments. But if the state department succeeded in its contentions it would have accomplished an amendment of the constitution without going through the difficulties of the amending process.

Expropriations.-Bolivia in March 1987, and Mexico in March 1938, on different excuses, expropriated U.S. oil properties, and Mexico agricultural properties as well. For the latter, Mexico first gave bonds, then mere receipts, then nothing. In response to the United States protest, Mexico answered that United States citizens were treated no differently from Mexicans and that by article nine of the Montevideo convention foreigners and nationals were to be treated the same way. Secretary Hull denied the validity of this contention, contending that he had made a reservation of international law and that that law did not imply an equality of mistreatment. After a commission had been appointed to evaluate the agricultural properties, Mexico agreed to make payment over a number of years, but reserved the validity of her contentions. The Mexican oil expropriation, while first met by an insistent United States claim for compensation of the value taken, was countered by Mexico by a peculiar Mexican law of valuing the surface properties only. The approach of the European war enabled the issue to be settled by the appointment of an evaluating commission of two, one appointed by each country. This was in 1942, under an agreement of 1941. Although the companies were promised by Secretary Hull that the subsoil petroleum would be taken into account by the appraisers, the final figure of some \$23,000,000 was a blind figure and outsiders did not know how it was arrived at. Possibly the subsoil petroleum was not taken into account. If this were true, the oil companies made a great sacrifice in the national interest. Their claim amounted to more than \$100,000,000. The claim of the British remained unsettled, although broken diplomatic relations were later renewed.

United Nations.—Near the close of World War II, the United States took the lead in establishing an organization of the nations which was to safeguard peace. The draft of a charter was made at Dumbarton Oaks (1944), and a revised draft at San Francisco (1945). The theory was that the United Nations, controlling the world, would find out wherever a threat to peace existed and by force if necessary

eliminate the threat, thus preserving the peace. They were to down "aggressors" by united action and apply sanctions to the guilty. The large powers (five) were to be the matrix of a security council and had to agree unanimously. But seven votes out of eleven would determine action by the security council, which was to remain in constant session. The assembly was to consist of representatives of all the United Nations and was to meet annually and to make recommendations on questions with which the security council did not deal. Each of the five great powers in the security council could frustrate action by the United Nations by interposing a veto.

This system was announced to the world as one designed to assure peace. The theory was indulged that the reason for the failure of the League of Nations was due to a lack of force and the absence of the United States. The League was abolished because in 1939 it had expelled the U.S.S.R., now by the turn of events one of the most important powers in the world. It was assumed that the five great powers would always see eye to eye.

The United Nations could not overcome its first hurdle because Russia seemed unable to agree with any of the other powers. An association of some nations and not others foreshadowed its doom. The five powers arrogated to themselves the management of the world so that all the other powers were actually small nations. The large powers, who alone endangered peace, could not be controlled. The United Nations were assumed to be peace-loving nations, the certificate of admission to the conference being a declaration of war against the axis. Critics might conclude that the U.N., in its first sessions, had barely avoided causing war between Russia and Britain in Iran, and seemed in danger of instigating a war with Franco Spain. The contribution to peace was not apparent. Russia even declined to answer a request for information by the U.N. Every part of the theory seemed unsound and had heretofore failed. Collective security seemed a myth. What a partial coalition amounted to was an agreement to maintain the status quo. Never had such an agreement lasted

Sanctions and the threat of military force which some apparently believed to be peaceful "measures short of war," were a powerful incentive to self-sufficiency and nationalism, evident in every section of the proposed charter. The adamant veto of the great powers was the expression not only of fundamental nationalism but also a mark of the impotence of the new organization. It would not have been possible to create a strong organization and obtain for it the support of 50 powers. The fact that general support was obtained implied an assumed innocuousness in accomplishing results, though as will be seen, the only sacrifice was to be made by the United States. In spite of the avowal of "sovereign equality" of all states, the organization contemplated a division between five great powers who were to govern the world, and a great body of smaller powers whose destiny the former would determine, if they could achieve unanimity. This represented a precarious independence of small states, who were returned to a colonial status, since they had to seek a strong protector to prevent denunciation as an "aggressor" and to preserve their own existence. A student might well inquire what incentive the smaller nations had for signing such a suicidal compact, since they were required to offer their territory and troops to enforce the will of the great powers.

It was also announced that the organization would strengthen international law. But in its first months, member nations had only weakened it until its status was precarious. The introduction of sanctions-a Geneva invention-pursuant to the secret agreements of 1916 at London, insured the inequality of states and the subordination of the weak to the strong, and thus was a serious impairment of international law. The charter began by compelling all member nations to participate in joint action against an "aggressor" to the extent that they were committed and called upon by the security council. It thus abolished the privilege of neutrality, one of the great achievements of four centuries of history, designed to limit belligerency within narrow confines so as to enable some countries to stay out of war with a legal status and to permit peace to be restored without impossible difficulty. All this was now changed. All wars were now to become general and theoretically universal. Hence the continued talk of avoiding a "third world war"; no smaller war could be conceived. The phrase that "peace is indivisible" was belied by all history and was calculated to make war universal. International law could not be promoted by lip-service, but only by

"Justice" was mentioned three times as one of the objectives of the charter, and the assembly could recommend "measures for the peaceful adjustment of any situation regardless of origin which it deems likely to impair the general welfare . . ." What this power to recommend peaceful change would amount to remained unknown. Certainly it would not strike as a happy solution the nation that was asked to abandon territory or rights enjoyed. The unworkability of article 19 of the League of Nations covenant was well remembered. The introduction of the criterion of "justice," proper as it doubtless was, was liable to have unforeseen and unpleasant results, because "justice" is differently understood in national and international parlance. Justice internationally is looked upon differently by the victor and by the vanquished. If the victors were asked by recommendation of the members of the assembly to give up some of their gains which rested on no other right than force, were they not likely to resent the suggestion and to entrench themselves in their gain? A great power by its veto could possibly prevent the security council from voting on a situation which constituted a threat to the peace, if it or its satellite were required to make sacrifices. But resentments would nevertheless be created among the affected countries. If these situations occurred in eastern Europe or Asia, let us assume, why should the United States become involved? Abstractions could thus lead to serious trouble. The defeated powers could also jeopardize any definitive settlement by invoking at every opportunity the injustice they allegedly or actually will suffer.

Non-intervention had been a fundamental principle of U.S. policy. It had been reiterated in many inter-American conference resolutions, and some seemed to believe that intervention in the domestic affairs of a state was excluded by the charter. In 1943 assistant secretary of state Adolf Berle had remarked:

Nor have we any intention to scrap the well-settled policy of non-intervention in the affairs of other states. The policy of non-intervention in other peoples' affairs is and must be the first principle of sound doctrine. Unless this is the settled practice of nations, there can be no principle of sovereign equality among peace-loving states and probably no permanent peace at all.

And yet it must be admitted that intervention had become a powerful factor in U.S. life. The new ideology required intervention in the domestic affairs of foreign governments in order to insure a government's conformity to United States views of national and international policy. How else could the intervention in Argentina be justified? Writers asserted that United States intervention against so-called "aggression" required intervention against particular foreign governments and, it was suggested, should so require. This was the old Wilsonian Latin-American policy of 1913 which, universalized, led into the morass consequent upon two world wars. Who could say that the world had seen the last of war? Intervention had become a national policy confirmed by Dumbarton Oaks and San Francisco.

Only an "aggressor" was to be punished by the Security council. But what made a nation an "aggressor" was quite unknown. The term was undefined and undefinable, in spite of the attempts of Russia and others during the 1930s to give it definition. Again, it might be assumed by the uninformed that the decision of seven of the 11 members of the Security council, including the five permanent members, would be reached on objective considerations regardless of self-interest. Precisely the opposite was the record of experience. Decisions as to who was an "aggressor" were reached on the basis of alliances, prior commitments, political relations and self-interest-generally before real evidence became available. Possibly this method of arriving at a decision foreclosed unanimity of the Big Five. Unanimity had to be achieved, moreover, not merely as to the identity of the "aggressor" but as to the measures to be employed against him. These might be such as to terminate the existence of a state, so that smaller states had inferentially committed themselves to renounce their independence, whether they joined a great power or not. Moreover, it was not certain that revolutions might not be considered acts of aggression. If so, the American Revolution, and most similar revolutions, could have been stopped by the proposed organization. (See also United Nations.)

War Criminals. - Unprecedented trials proceeded at Nuernberg and Tokyo in which the victors established tribunals to try the leaders of the vanguished for war crimes, the crime of starting an aggressive war and committing crimes against humanity. Although the trial of the leaders of the defeated by the victor himself did not promote confidence in the judicial process, it was a fact that proven war crimes could be punished. But it was more doubtful whether there was such a thing as beginning aggressive war, and whether aggressive war could be pronounced a crime. The difficulty of juggling the word "aggressor" alone was a deterrent, for one should examine the historical reasons for conflict. Whether crimes against humanity could be imputed to the persons on trial was an open question. If they could be proved, punishment would elicit approval. (See also WAR CRIMES.)

Inter-American Policy.-Reference has been made to the Panama declaration, 1939, of a neutral zone of wide extent around the American continents with the exception of Canada. A meeting of the foreign ministers called at Havana in July 1940, following the occupation of France by Germany, led to a declaration that any attempt of a non-American state upon the integrity or inviolability of the territory of an American state would be considered an act of aggression against all of them. In Jan., 1942, a third meeting was called at Rio de Janeiro for the defense of the hemisphere and the elimination from the American continent of all axis diplomatic, political and economic influence. All except Argentina and Chile immediately broke off diplomatic relations with the axis. Chile followed Jan. 20, 1943. In 1945 the Chapultepec conference led to further agreements for inter-continental solidarity. All except Argentina participated in the conference. The conference stipulated the conditions on which Argentina might adhere, fundamental being the elimination of centres of axis influence. On March 27, 1945, Argentina declared war against the axis, and was thereupon invited to the United Nations conference, April 30, 1945, at San Francisco. (See also Pan-American Conferences, 1937–46.)

Atomic Bomb.—The discovery of the atomic bomb was subsidized by the U.S. administration and used during World War II in Hiroshima and Nagasaki. Subsequently its manufacture proceeded in the United States. Its domestic regulation was provided for in the bill introduced by Senator Brien McMahon, and passed by senate and house with amendments Aug. 1, 1946. Its international application was to be governed by a United States proposal advanced in the U.N. by Bernard Baruch. The essence of this proposal was that in return for divulging the secret of the manufacture and a promise to destroy the U.S. stock of bombs, foreign nations should in good faith, without veto, freely permit an inspection of all works calculated to produce the bomb, beginning with the raw material of uranium and thorium and ending with the manufacture itself. If foreign nations did not make the surrender of sovereignty implied in this freedom of inspection, the plan would fail and the United States presumably could continue manufacturing the bomb and not divulge the secret. The plan was applauded by a large part of the world as sensible and sound, and it remained to be seen whether the countries of the world would make sufficient sacrifice to permit the necessary inspection and supervision. Russia proposed a looser plan. (See also Atomic Bomb.)

World Government.—Realizing the deficiencies of U.N., a movement was under way in the United States during 1945 and 1946 to bring about world government. Since the states were unable to organize Europe in a unified fashion it seemed optimistic to suppose that they could organize the world in the form of a government. They had already dispensed with law as a binding cement, and ex-Justice Roberts in 1945 had announced that the law between nations was the law of "tooth and claw." The distrust among nations was great, and it seemed hardly possible that, however urgent the need, they would be in a position to establish a world government. While in view of the atomic bomb there was undoubtedly a need for such world government, it remained an open question whether the nations had fortitude enough to make the surrenders of national sovereignty which such government implied. (See also International Court of Justice; Law; Per-MANENT COURT OF INTERNATIONAL JUSTICE; PRISONERS OF WAR: WORLD POLITICAL ALIGNMENTS, POSTWAR.) (E. BD.)

700 International Monetary Fund

Proposals for far-reaching co-operation in the international monetary sphere through the establishment of the International Monetary fund and the International Bank for Reconstruction and Development (q.v.) were agreed on at the International Monetary and Financial conference held at Bretton Woods, N.H., in July 1944. The fund and bank came into existence in Dec. 1945, when the proposals had been accepted by the required number of the governments represented at Bretton Woods. Both institutions aimed to promote the balanced growth of world trade and the maintenance of high levels of employment. Each institution, however, had its own special function: The bank to encourage the international flow of long-term capital to meet reconstruction and development needs; and the fund to help establish and maintain orderly currency practices.

The fund was established to promote orderly currency practices in two principal ways. After establishing a suitable pattern of initial exchange rates between member currencies, the fund would ensure reasonable stability in rates while providing for orderly changes when necessary. It would also eliminate harmful restrictions on current international payments and discriminatory currency arrangements. In order to help members maintain stable and unrestricted exchange relationships, the fund had resources of gold and currencies which it could make available to them to meet deficits in their current international payments

The fund's responsibilities with respect to exchange rates were of primary importance. At the outset each member had to agree with the fund on the initial par value of its currency in terms of gold. The fund was to aim at the establishment of a pattern of postwar exchange rates consistent with balance in the international transactions of members in order to facilitate the return to normal trade and the maintenance of stable exchange rates. After a member had agreed with the fund on the par value of its currency it was obligated to maintain the agreed par value and to propose a change only when necessary to correct a fundamental disequilibrium. Changes totalling 10% might be made after consultation with the fund; any further change could be made only with the approval of the fund. The fund would approve any change necessary to correct a fundamental disequilibrium. Reasonable stability of exchange rates would promote trade and productive investment by reducing exchange risks. Orderly changes in rates when necessary, however, would help to maintain a higher level of world trade and employment by enabling members to avoid harmful deflationary pressures and restrictions on current payments.

The fund's responsibilities with respect to exchange restrictions were also important. The fund aimed to eliminate restrictions on payments for current international transactions which were a serious obstacle to the revival and expansion of trade. No member could impose restrictions on current payments or engage in any discriminatory currency arrangements without the approval of the fund. During the postwar transition period members could maintain and adapt existing restrictions, but they were obligated to eliminate such restrictions as soon as possible.

The fund was to have resources of approximately \$8,000,000,000, contributed by member countries. When the fund had reached agreement with the majority of member countries on the initial par values of their currencies and

was ready to begin exchange operations, each member would be required to contribute an amount equal to its assigned quota, partly in gold and partly in its own currency. Each member was required to pay in gold 25% of its quota or 10% of its net official holdings of gold and United States dollars, whichever was the smaller. The resources of the fund were to be used to help members meet deficits in their international payments.

A member could purchase foreign currencies from the fund in exchange for its own currency until the fund's holdings of its currency equalled 200% of its quota, provided the increase in the fund's holdings of its currency did not exceed 25% of its quota in any 12-month period. These quantitative limits could be exceeded with special permission. There were also qualitative limitations on the use of the fund by member countries. A member was expected to use the fund to meet temporary deficits in its current international payments and had to take positive measures to correct its international position should its deficit prove to be more than temporary. A member was also expected to repurchase its currency from the fund within a reasonable period of time and was required to do so under certain conditions. The fund had to maintain a balance in its holdings of member currencies in order to be in a position to furnish the currencies needed by members. If the fund's holdings of any currency were tending to be exhausted, the fund would take measures to correct the situation. These measures included recommendations to member countries designed to restore balance in their international transactions. If necessary, the fund could declare a currency scarce and limit purchases by member countries. In such circumstances members were permitted to restrict payments in the scarce currency under certain conditions.

Ultimate control of the fund was vested in a board of governors composed of one governor appointed by each member. The board was required to meet at least once a year. A body of 12 executive directors was made responsible for the current operations of the fund. Five of the directors were appointed by the five members having the largest quotas, two elected by the Latin American republics and the remaining five elected by all the other members. The chief of the operating staff of the fund was the managing director, selected by the executive directors. Each member had 250 votes plus one vote for each \$100,-000 of its subscription to the fund. In voting by the board of governors, the governor appointed by each member cast the number of votes allotted to that member. Each executive director cast the number of votes either of the member appointing him or of the members whose votes counted toward his election.

The board of governors of the fund held its first meeting at Wilmington Island near Savannah, Ga., in March 1946 and its second meeting in Washington in Sept. 1946. The first election of executive directors was held at the March meeting and it was agreed to locate the main office of the fund in Washington.

The first annual meeting of the board of governors, held in Washington, D.C., at the end of September and early Oct. 1946, was marked by an atmosphere of amicability and co-operation. In a few days, decisions were taken to admit Italy, Turkey, Syria and Lebanon into the fund. Readjustments were made in the quotas of Paraguay and France.

In the following months the fund made an extensive study of the problems involved in establishing initial par values and in Dec. 1946, completed the major task of determining initial par values. All was thus put in readiness tor the actual exchange operations of the fund. It was specified that member countries, beginning on March 1, 1947, would be able to draw on the fund's resources to meet temporary balance of payments difficulties and could thus accelerate the achievement of domestic economic and monetary stability on higher levels of income, production, and foreign trade than would otherwise be possible. It was expected that the operations and activities of the fund would result in curtailing restrictive and discriminatory exchange practices and prevent a return to the widespread and disrupting unilateral and competitive exchange rate changes of the 1930s. Above all, it was hoped that the fund would promote a high degree of international collaboration in monetary and exchange policies and practices.

International Organizations

During the decade 1937-46, several hundred international organizations were engaged in mutual co-operation over a wide area. Their work embraced many fields—law, economics, education and cultural exchanges, health, transport and communications, agriculture and labour and social problems.

As a result of World War II, some international agencies were forced either to suspend or drastically curtail their activities. Global warfare against the axis, however, brought the creation of many new international organizations.

Some of these were formed to co-ordinate joint war efforts, while others, such as the Allied Control Council for Germany, were established to deal with occupational and other postwar problems.

The establishment of the United Nations, which took over many of the nonpolitical activities of the League of Nations, gave a new and powerful impetus to world collaboration. Pursuant to the directive contained in Article 57 of the United Nations charter, steps were taken in 1946 to bring into relationship with the United Nations various specialized international agencies created by previous intergovernmental agreement in social, cultural, economic, health, educational and related fields.

Among the more important international bodies active during the decade 1937-46 with a brief description of each, were the following:

American International Institute for the Protection of Childhood.—Located at Montevideo, Uruguay, the institute was created in 1927 to provide an American centre of social welfare activities on all matters related to child welfare and child life, with work carried on by an international council, consisting of two delegates from each member country, supervised by a director and chosen by majority vote of the council.

Caribbean Commission.—This organization was established in March 1942 as the Anglo-American Caribbean commission to promote social and economic co-operation between the United States and its possessions and bases in the Caribbean and British colonies in the same area. It was the first agency created jointly by two colonial powers to assist them in administering their respective possessions in a specified geographical area. In 1943 the commission set up the Caribbean Research council to serve in an advisory capacity to encourage scientific, technological, social and economic research for the benefit of the peoples of the Caribbean area. In Dec. 1945 the Netherlands and France became members of the Caribbean commission.

Central Bureau of the International Map of the World.—Principal function of the bureau, located at Southampton, England, was to serve as a liaison and information agency to assist the several governments in co-ordinating plans for publishing an international map of the world on the scale 1:1,000,000, with conventional signs standardized and printed on common sheet lines. Sheets of the map, covering the U.S. and its possessions, were compiled and published by the U.S. geological survey. The bureau was established in 1913.

Combined Chiefs of Staff.—(See Chiefs of Staff, Combined and Joint).

Committee of Experts on the Codification of International Law.—Consisting of nine jurists elected by the various American governments, the committee was created pursuant to a resolution adopted by the seventh International Conference of American States which met at Montevideo, Uruguay, in 1933. Its duties were further defined and increased by the Inter-American Conference for the Maintenance of Peace in 1936, and the eighth International Conference of American States in 1938. The committee's work was divided into two phases: general codification of international law and the consideration of special topics referred to it by the various conferences.

Emergency Advisory Committee for Political Defense.—The committee was created to carry out the program of political defense agreed upon by the third meeting of the Ministers of Foreign Affairs of the American Republics at Rio de Janiero, Brazil, in Jan. 1942, soon after the attack on Pearl Harbor. Included in this program were protective measures against subversive activities by axis government agents and sympathizers. The committee, with offices at Montevideo, was composed of seven members appointed by seven American republics designated for that purpose by the Pan American Union. The Inter-American Conference on Problems of War and Peace, held in Mexico City in 1945, directed the committee to continue its work through the postwar transitional period.

European Advisory Commission.—(See separate article). European Central Inland Transport Organization.—The purpose of this organization was to assure the most efficient movement of international traffic on railroads, inland waterways and roads. Its formation resulted from an agreement signed in Sept. 1945 by 11 countries—Belgium, Czechoslovakia, France, Greece, Luxembourg, the Netherlands, Norway, soviet Russia, Yugoslavia, the United Kingdom and the United States. The agreement was later signed by Poland and Denmark.

The organization consisted of a council, on which all signatories were represented and a chief officer, or director general, with a staff.

Inter-Allied Reparations Agency. — See REPARATIONS (WORLD WAR II).

Inter-American Coffee Board.—The board, with offices in Washington, D.C., was formed under the Inter-American Coffee Agreement of 1940, to facilitate the orderly marketing of coffee during the war period. The 14 Latin American countries signing the agreement represented approximately 85% of world coffee production, with the U.S., largest coffee consumer, as the other signatory. The agreement, which fixed basic quotas for the export of coffee to the U.S., was extended to one year from Oct. 1, 1946.

Inter-American Commission of Women.—Created by the eighth International Conference of American States in 1938, the commission was charged with the permanent

study "of all the problems concerning American women." Each of the 21 American republics was represented on the commission, whose headquarters were established in the Pan American Union.

Inter-American Defense Board.—The board was created in 1942, to study and recommend measures for the defense of the western hemisphere, under a resolution adopted by the third meeting of the Ministers of Foreign Affairs of the American Republics at Rio de Janeiro. The board, composed of army, navy and air force officers appointed by the governments of the American republics, had its offices in Washington, D.C.

Inter-American Economic and Social Council.—The council was set up in 1945 to replace the Inter-American Financial and Economic Advisory committee. In addition to serving as the co-ordinating agency for all official inter-American economic and social organizations, it carried on studies on financial and economic problems arising out of the war. The council's first meeting was held in Washington, D.C., in 1945.

Inter-American Indian Institute.—The institute was formed in 1940 to conduct scientific investigations of Indian problems and promote the welfare of the Indian populations of the countries ratifying the 1940 convention. Management of the institute was vested in a governing board consisting of a representative from each member state. The director of the institute and the executive committee were to be chosen by the governing board. Offices of the institute were set up in Mexico City.

Inter-American Institute of Agricultural Sciences.—The institute was organized in 1942 to promote the development of agricultural sciences in the American republics through research, teaching and extension activities. It was divided into four major departments: animal industry, agricultural engineering, plant industry and soils, economics and rural life, each headed by a scientist whose primary concern was to organize and conduct research and teach a limited number of graduate students. The institute maintained executive offices in the Pan American Union, with field headquarters at Turrialba, Costa Rica.

Inter-American Juridical Committee.—Composed of seven experts in international law, the committee, located at Rio de Janeiro, was created in 1942 as successor to the Inter-American Neutrality committee. It dealt with four main types of problems: (1) juridical problems arising out of World War II; (2) postwar problems; (3) codification of international law; and (4) co-ordination of the resolutions of the Foreign Ministers of the American Republics.

Inter-American Statistical Institute.—The institute was created in 1941 to promote statistical development and provide a medium for collaboration among statisticians of the western hemisphere. The first meeting was held in Charlottesville, Va., in 1942. The institute in 1946 had approximately 80 members, including individuals, institutions and governments.

Intergovernmental Committee on Refugees.—The committee was organized in London in 1938 to facilitate the emigration of persons forced to leave central Europe because of their political opinions, religious beliefs or racial origin, and assist the settlement of such persons elsewhere, principally overseas. On Jan. 1, 1946, 36 governments were represented on the committee.

International Bank for Reconstruction and Development.—(See separate article.)

International Boundary Commission-United States,

Alaska and Canada.—The commission was created under the provisions of the several boundary treaties between the U.S. and Great Britain for the purpose of defining, marking and maintaining the demarcation of the international boundary line between the U.S. and Canada, and between Alaska and Canada. It established offices in both Washington, D.C., and Ottawa, Ont.

International Boundary Commission—United States and Mexico.—Set up under the convention of 1889, the commission was given jurisdiction in deciding boundary questions between the two countries. In 1932, the U.S. section of the commission took over the functions previously exercised by the U.S. section of the International Water commission, United States and Mexico. The U.S. offices of the commission were located at El Paso, Texas, and the Mexican offices at Ciudad Juárez.

International Bureau for the Protection of Industrial Property.—The bureau was established in Berne, Switzerland, in 1884 to centralize information relating to industrial property, particularly such matters as patents, trade marks and commercial names of interest to member nations. It was supervised by the Swiss government.

International Bureau for Publication of Customs Tariffs.—Functions of the bureau, established in Brussels, Belgium, in 1891, were to translate and publish in five languages—English, French, German, Italian and Spanish—customs tariffs and commercial treaties of all countries. In both World Wars, it continued to function during the German occupations of Belgium.

International Bureau of Weights and Measures.—Established in 1876 to carry on scientific investigations relating to weights and measures, the bureau was under the direction of the International Committee on Weights and Measures, composed of 18 members, each from a different country. The International committee held its first meeting after World War II in Paris, France, in Nov. 1945. Offices of the bureau were in Sèvres, France.

International Commission on Historic Monuments.— The commission was formed in 1934 to promote the establishment of organizations responsible for protecting monuments in countries where no such agencies existed, and to develop in the public mind an increasing respect for monuments. Headquarters of the commission were in Paris, France.

International Cotton Advisory Committee.—The committee was created in 1939 to keep in touch with the international cotton situation, with the ultimate goal of achieving an international cotton agreement for the regulation of world supplies in relation to demand. The principal cotton producing and exporting countries were represented on the committee. A secretariat was set up at Washington, D.C., in May 1946.

International Council of Scientific Unions.—Established in 1919 as a co-ordinating agency, the council, located at Brussels, Belgium, included representatives from approximately 30 countries in 1946. U.S. members were the National Academy of Sciences and the National Research council.

International Court of Justice.—(See separate article.)
International Criminal Police Commission.—The com-

mission was formed in Vienna in 1923 to encourage mutual assistance among the criminal investigation departments of the various nations and promote the development of institutions capable of contributing toward the suppression of crime. Following the annexation of Austria, the headquarters of the commission were taken over by the German government and removed to Berlin in 1941.

International Emergency Food Council.-The council,

composed of representatives of approximately 20 countries, was established in Washington, D.C., in June 1946 to allocate world food resources among needy nations during the postwar emergency period. It replaced the Combined Food board created in 1942 by the U.S., Great Britain and Canada.

International Fisheries Commission—United States and Canada.—The commission was set up under the convention of 1923 to conserve the halibut fisheries of the North Pacific and the Bering sea. Its powers were expanded under the 1930 and 1937 conventions. The commission had its offices in Seattle, Wash.

International Hydrographic Bureau.—The bureau was organized in Monte Carlo, Monaco, in 1921 to improve the hydrographic work of the participating governments. It was directed by a committee of three members elected at the periodic conferences of members. Although its activities were curtailed, the bureau continued to operate during World War II.

International Institute of Agriculture.—Created by the 1905 convention, which was signed by representatives of 40 governments, the institute operated as a clearing house for the collection, analysis and distribution of information on agricultural statistics, legislation and economic and technical problems. It also organized and published the results of world agricultural censuses. The institute, whose headquarters were in Rome, was dissolved in 1946.

International Institute of Statistics.—Established in 1913, the institute, located at The Hague, Neth., was a professional organization of statisticians, most of whom were officially connected with their respective governments. Its aim was to improve the quality, scope and the international comparability of official statistics. By reducing salaries and other costs, the institute was able to carry on a number of its scientific services during the German occupation of the Netherlands in World War II.

International Joint Commission—United States and Canada.—The commission was created by the 1909 treaty between Great Britain and the U.S. to decide disputes between the U.S. and Canada regarding boundaries and the use of boundary waters. The commission was composed of three commissioners representing the U.S. and three representing Canada, and maintained offices in Washington, D.C., and Ottawa, Ont.

International Labour Organization.—(See separate article.)

International Meteorological Organization.—Development of international meteorology and the standardization of meteorological services were the principal functions of the organization, formed in the Netherlands in 1878. Its offices were moved from De Bilt, Neth., to Lausanne, Switzerland, in 1939.

International Monetary Fund.—(See separate article.)

International Office of Public Health.—The office was established in 1907 at Paris to collect and distribute to member nations facts and documents relating to public health and arrange for the holding of international conferences to revise or conclude sanitary conventions. The office was supervised by a permanent committee consisting of technical representatives designated by the participating governments.

International Pacific Salmon Fisheries Commission, United States and Canada.—The commission was set up under the 1930 convention to provide for the protection and development of the sockeye salmon industry. Its headquarters were in New Westminster, British Columbia.

International Penal and Penitentiary Commission.-

The commission, organized in 1872, was the permanent executive body of the international prison congresses. Composed of penologists from each member country, its headquarters were in Berne, Switzerland.

International Seed Testing Association.—Composed of officials charged with the testing of seeds in member countries, the association was established in 1924, at Copenhagen, Denmark, to secure the standardization of seed testing methods. A congress scheduled to be held in Washington, D.C., in 1940, was cancelled by World War II.

International Sugar Council.—The council was charged with administering the 1937 International Sugar agreement, under which 17 exporting countries and the Commonwealth of the Philippines agreed to limit their sugar exports to the so-called "world-free market." The agreement was also signed by four importing countries—China, India, the United Kingdom and the U.S. The council maintained an office in London, Eng.

International Technical Committee of Aerial Legal Experts.—Organized by the first International Conference on Private Aerial Law which met in Paris in 1925, the committee was charged with developing a comprehensive code of private aerial law through the adoption of international conventions on various subjects of private aerial law. Its offices were established in Paris.

International Telecommunications Union.—The union was established in Berne, Switzerland, in 1934, as successor to the International Bureau of the Telegraph Union. The bureau of the union had two sections, one dealing with telegraph service, the other with radio service. The bureau assisted in organizing international conferences and collected and distributed to members information on international telecommunications.

International Wheat Council.—Successor to the International Wheat Advisory committee, the council, during World War II, served as a central agency for administering and co-ordinating the work of implementing the commitments of member nations to a pool of wheat earmarked for the relief of war-stricken or other needy areas. Members of the council, with offices in Washington, D.C., were Argentina, Australia, Canada, the U.K. and the U.S.

Interparliamentary Union.-Composed of members of legislative bodies, the union was established in Paris in 1888 to encourage international peace and co-operation and to study international questions suitable for settlement by parliamentary action. Membership was by national groups. Each group, limited to members of parliamentary bodies, possessed its own organization. International conferences were made up of delegates from these groups. The union established seven permanent study commissions to deal with the following: political and organizational questions; economic and financial questions; juridical questions; ethnic and colonial questions; reduction of armaments; social and humanitarian questions; and phases of intellectual co-operation. Though World War II interrupted the work of the union, many of the parliamentary groups remained intact. An entente of members of parliaments of the occupied countries, comprising groups from Belgium, France, Luxembourg, Norway, Czechoslovakia and Yugoslavia, was also set up in London.

Joint Aircraft Committee.—The first joint Anglo-American committee established in the U.S. for co-operation in the conduct of World War II, this body was organized in Sept. 1940. Originally known as the Army-Navy-British Purchasing Commission Joint committee it received in April 1941 the designation "Joint Aircraft committee."

It integrated production plans in a single production schedule, and exercised supreme authority over the approval of all aircraft contracts in the U.S. Membership included two members each from the U.S. army air forces, the U.S. navy, the British Supply council and the Aircraft Production board of the War Production board. Its activities were decentralized into a number of subcommittees, which investigated facts in individual cases and made appropriate recommendations to the committee.

Joint Brazil-United States Defense Commission.—The commission, which held its first meeting in Washington, D.C., in Aug. 1942, was created to co-ordinate the military efforts of the two countries and prepare staff plans for mutual defense.

Joint Mexican-United States Defense Commission.—Created early in 1942 to study defense problems of the two countries, the commission was instrumental in strengthening Mexican ground and air forces, training Mexican personnel in the U.S. and arranging for the use by U.S. warships and aircraft of Mexican bases and airfields.

Office of Inter-American Telecommunications.—Pursuant to a convention concluded at Rio de Janeiro in 1945 by the third Inter-American Radio conference, the office was maintained at Havana, Cuba, as an advisory, consultative and informational body. Its formation was an outgrowth of the increasing need for an inter-American agreement in the field of radio communications.

Pacific War Council.—Organized to consider broad questions relating to the war effort in the Pacific, the council held its first meeting in Washington, D.C., April 1, 1942. It was composed of the president of the U.S., and the diplomatic representatives in Washington, D.C., of Australia, Canada, China, the Netherlands, New Zealand and the U.K., with the Philippine commonwealth represented on the council by its president.

Pan-American Institute of Geography and History.— The institute was set up in 1929 to encourage the collection and dissemination of information on geographic and historical questions of interest to the Latin-American republics. Many explorations and surveys in these fields were conducted under its supervision. As a war measure, the institute in 1941 established a commission on cartography to expedite the work of surveying and mapping all the American republics. Offices of the institute were established in Mexico City.

Pan-American Railway Committee.—The committee was successor to the International Railway commission, established under a resolution of the First International Conference of American States in 1889 to determine the feasibility of an international railway from New York to Buenos Aires. Continuing the work of the commission, the committee collected information on the inter-American railway project, of which approximately 7,000 miles had been constructed in 1946. Its offices were in Buenos Aires.

Pan-American Sanitary Bureau.—Organized in 1902, the bureau became the central co-ordinating body for public health in the western hemisphere. Its functions in 1946 were laid down by the Pan-American Sanitary Code of 1924, which was ratified by all of the 21 American republics. It was supervised by a directing council, composed of leading health experts, chosen by the Pan-American Sanitary conferences. The bureau was located in Washington, D.C.

Pan American Union.—(See separate article.)

Permanent American Aeronautical Commission.—The commission was created by the First Inter-American Technical Aviation conference in 1937 to promote the codi-

fication of air law, the organization and marking of inter-American air routes and the development of air navigation facilities.

Permanent Association of Navigation Congresses.—The association was created in 1900 to promote inland and maritime navigation by means of organized international congresses. The governing body was the Permanent International commission, located in Brussels, Belg.

Permanent Association of Road Congresses.—Organization of the association was the result of the first road congress, composed of representatives of 33 nations, which met at Paris in 1908. It was formed to encourage the construction and exploitation of roads through organizing road congresses, publication of technical papers, and collecting the results of tests on materials for road construction and maintenance.

Permanent Committee of Havana.—The committee was established by the Sixth International Conference of American States in 1928 to study comparative legislation and the unification of legislation. The 1928 conference also provided for two other groups; the Permanent Committee of Rio de Janeiro on the Codification of Public International Law, and the Permanent Committee of Montevideo on the Codification of Private International Law. Membership of the three committees was originally confined to nationals of the countries where the committees were respectively located, but in 1938, the Eighth International Conference of American States adopted a resolution providing for the addition to each committee of six members not nationals of the country in which each committee was located.

Permanent Committee of Jurists on Unification of Civil and Commercial Laws.—The committee was set up in 1938 to study and prepare the unification of the civil and commercial laws of America. The committee, located at Lima, Peru, had three members, and functioned under the supervision of the law faculty of the University of San Marcos.

Permanent Court of Arbitration (The Hague).—The court was established under the Hague Convention of 1899 and 1907 to facilitate immediate recourse to arbitration of international disputes which could not be settled by diplomacy. Its organization was designed to include a panel of court members, an administrative council consisting of the minister of foreign affairs of the Netherlands and foreign diplomats accredited to The Hague, and the international bureau, consisting of the secretary general and a small staff serving as a registry for the court.

Permanent Court of International Justice.—(See separate article.)

Permanent Joint Board on Defense—United States and Canada.—(See Canadian—U.S. War Committees.)

Postal Union of the Americas and Spain.—The union succeeded the Pan American Postal Union, established at the first Pan American Postal congress held at Buenos Aires in 1921. The international office of the union, located at Montevideo, Uruguay, served as an organ of liaison, information and consultation for member countries. It assembled and distributed information concerning the American-Spanish postal service, and gave opinions on disputed questions. The office was supervised by the Administration of Post of Uruguay.

Provisional International Civil Aviation Organization. The organization was set up following the International Civil Aviation conference, held in Chicago, in 1945, in which 54 governments were represented. It was established as an advisory and technical body for a period not exceeding three years, to be replaced by a permanent civil

aviation agency. The Interim council, executive instrument of the organization, was charged with framing and recommending adoption of technical standards and procedures, and making reports on matters relating to air navigation and international air transport. The conference decided that the council should be composed of not more than 21 members, elected by the Interim assembly, meeting annually and composed of representatives of all member states. Three main committees organized under the council were the Air Navigation committee, the Air Transport committee and the International Convention committee.

Rubber Study Group.—The group was formed in Sept. 1944 by the Netherlands, the U.K. and the U.S. to consider problems of mutual concern relating to rubber—synthetic, natural and reclaim. France was later invited to participate in its work. The group made recommendations and assembled factual information for governments interested in the rubber problem.

United Nations.—For a description of the parent organization and its principal subsidiary and related organizations see United Nations.

United Nations Relief and Rehabilitation Organization (U.N.R.R.A.).—(See separate article.)

Universal Postal Union.—The union was established by the Treaty of Berne in 1874 to improve international postal communications by uniting member countries in a single postal territory for the reciprocal exchange of mail. The union maintained a central agency, the International bureau, located at Berne. The bureau, administered by the Swiss government, served as a clearinghouse of information on postal matters, and on the request of the parties at issue, arbitrated postal disputes. Although postal services were drastically curtailed or suspended with many countries during World War II, the International bureau continued to operate.

Wheat Advisory Committee.—The committee was established under the final act of the Conference of Wheat Exporting and Importing Countries, signed at London by representatives of 22 countries on Aug. 25, 1933. The committee functioned in an advisory capacity, and prepared statistical analyses of the world wheat situation for the benefit of the participating governments. The organization ceased to function with the convening of the International Wheat Council in 1942. (See also British-U.S. WAR BOARDS; CANADIAN-U.S. WAR COMMITTEES; INTERNATIONAL CONFERENCES, ALLIED [WORLD WAR II]; PAN-AMERICAN CONFERENCES, 1937—46.)

International Trade

The years 1937 and 1938 were the last years prior to World War II in which the trade of any of the leading countries of the world could be considered more or less normal. Even during these years political tensions were high, especially after the Munich crisis in the fall of 1938.

Such tensions were not peculiar to 1937-38, however;

crisis had followed crisis in monotonous repetition after the Japanese occupation of Manchuria in 1931. Except in relatively limited areas and with reference to particular commodities, the influences of these crises on the flow of world trade were not great.

Prewar Cyclical Peak.—In 1937 and 1938, the chief interest in world trade in most countries continued to be focused on its relation to internal economic activity—a continuation of the developments of the depression years of the early 1930s. Indeed, cyclical factors appear to have had a dominating influence on the flow of trade. The year 1937 represented a peak in the recovery of world trade from the depths of the great depression.

Year to year comparisons of total world trade had always been complicated by problems of converting the values of trade for various countries from their values in the various national currencies into a common unit of measure of value. Methods of evaluating and recording exports and imports also differed between countries. Even with an international gold standard in force, the solutions of these problems were difficult; figures for total world trade had to remain approximations.

In the 1930s these problems were complicated by manipulations of exchange rates called "exchange control" and by all the other ingenious devices man could devise to restrict trade. Some of these merely limited or modified the flow of trade; others made it more difficult to measure and evaluate what trade actually did flow. Nevertheless, in terms of billions, the figures were accurate enough for rough comparisons.

During the world-wide depression of the early 1930s, the United States, the United Kingdom, Germany, France, Japan, Canada—all the large countries and most of the small ones—experienced sharp declines in their foreign trade as well as their domestic economic activity. Declining prices and increasing unemployment spread everywhere. Although the exact timing of the cycle varied between countries, total world trade reached bottom in 1932. In this year, exports of 109 countries comprising most of the world totalled \$12,600,000,000—a decline of more than 60% from the peak during 1929. Prices in world markets had dropped too, of course—by perhaps 35%. Thus the actual volume of goods exchanged had declined by approximately 40%.

Recovery was slow, hampered by the restrictions imposed by growing economic nationalism and the sometimes sincere desire to promote internal programs for recovery and reform. The year 1936 was a fairly good one for the foreign trade of most countries. By 1937, total world exports had reached \$25,000,000,000—a figure destined to become the post-depression, prewar peak. In dollar values, trade was double the depression low, although it was still 24% below 1929. Prices had also risen by some 55%. When adjustments are made for the differences in relative prices, the resulting index of the physical quantity of trade for 1937 was 30% above the 1932 low and 22% below the 1929 peak. Unemployment continued to be widespread except in Germany, Japan and Italy, where war production was already under way.

1938–39 Recession.—In 1938, the pendulum of economic activity had reversed its course, and world trade began to decline once more. As before, the decline was accompanied by recessions in the internal business activity of many countries. Both exports and imports of 21 of the 25 leading countries declined. Exports of two others declined; for one other, imports fell off. The over-all decline in exports

was 13%. Loss in the volume of the trade movement, however, was only about 8% as there was also a decline in average prices estimated at 5%. In the nature of trade, the course of world imports was similar to that of world exports.

The dominant factor in the decline of world trade during 1938 was the lower level of industrial activity in the United States, the largest consumer of raw materials. The recession of industrial activity in the United States had already influenced world trade in the latter part of 1937 and became more prominent in 1938, especially in the first half year. This development was indirectly responsible in part for the lower world export trade by cutting down the exports of the principal supplying countries. The familiar pattern of declining prices for basic foodstuffs and raw materials, and its influence toward cumulative reductions of exports and imports by countries specializing in the production of foods and raw materials for export (an important factor contributing to the severity of the great depression) was repeated. Argentina, Chile, British Malaya and the Netherlands Indies were among those caught in

In addition to the sharp reduction of imports by the United States, exceptionally large reductions also occurred in the trade of Japan, France and Italy. In contrast with the United States, deliberate trade restrictions played an important part in these reductions. The major exception to the lower level of imports was Germany which, though it curtailed imports of nonessentials, was already active in accumulating large supplies of strategic raw materials and basic foodstuffs.

Most of the evidence pointed to a continued decline in world trade during 1939 had it not been for the growth of armament activity on a wide scale and the outbreak of World War II in Sept. 1939. However, although it was a statistical fact that the aggregate turnover in world trade, imports and exports combined, for the 25 leading countries was slightly lower in dollar value during 1939 than in 1938, the abnormal character of world trade movements just before and after the beginning of the war prohibited reliable generalizations concerning them.

Depression: Breeding Ground for War.—Business cycle fluctuations in world trade affect the exports and imports of industrialized and nonindustrialized countries differently. Thus the selection of a period for a description of the pattern of world trade should include prosperous and unfavourable years. For this reason, the years 1936–38 have been used for a description of the prewar patterns of world trade.

Although largely free of war influences, the years 1936–38 were not precisely years of "free trade." They were the culmination of a decade during which internationalism had waged a losing battle against the rising tide of economic nationalism. Free trade was in its twilight. The story is a long one, but a summary of its major events may serve to recall its background. The setting was one of apparent surplus production in many lines, particularly in countries specializing in the production of war materials and staple foods. Unemployment was prevalent in many nations and continued to be so in varying degrees right up to the outbreak of World War II.

Opinions differed as to the particular event which set off the cumulative deflation on an international scale. Some held that it was the Smoot-Hawley act of 1930 which raised tariffs in the United States to record highs; some that it was the financial crisis in Europe created by the failure of

the Credit-Anstalt in Austria and the impossibility of meeting established reparations payments which necessitated the famous "Hoover moratorium." Still others held that it was the restoration of agricultural production in Europe, combined with a drive on the part of many European countries to become economically self-sufficient. In any case, the depression in the United States with its drastic reduction of incomes and industrial production in that country by itself would have had a serious impact on world markets, since the United States was then the world's second largest importer.

Countries outside Europe producing agricultural products and raw materials were having difficulties arising from overproduction and falling prices even before the Wall Street crash in Sept. 1929. The sharp curtailment of foreign lending by private investors in the United States after 1930 aggravated already difficult situations with respect to the balances of payments of many of these countries. It also endangered the balances of payments and foreign exchange positions of many industrial European countries faced with serious currency problems arising from reparations payments and service charges on debts incurred for postwar reconstruction. With many countries in debt to the United States and prices for their products falling, an increase in United States tariffs against the products which other countries might ship in payment of their obligations could scarcely be expected to ease the international situation, however justified the measure might be for internal reasons.

One thing led to another in the mounting storm which was climaxed by resort to armed conflict. In Sept. 1931 Britain abandoned the gold standard. Empire countries followed suit. Then came the first comprehensive British tariff since the repeal of the Corn laws, to be followed by the "imperial preference" system, outcome of the Ottawa conference in 1932. The "sterling bloc," a co-operative trade arrangement among empire countries and a few others, developed gradually from 1931 to 1939 as a substitute for the gold standard. When Britain declared war on Germany in Sept. 1939, the "bloc" was eliminated in favour of the "sterling area" officially recognized by statutory rules and order no. 1254 of July 17, 1940, as a war measure.

Continued deterioration of Germany's foreign exchange position in 1933 and the exclusion of its products from many foreign markets by prohibitive tariffs and other restrictive measures impelled Germany to resort to antiquated methods of foreign trading. The "Schacht" economic program gained prominence; this plan involved foreign exchange rationing, import quotas and barter deals with countries in southeastern Europe and South America for raw materials in exchange for German machinery. Exporters were granted exorbitant subsidies to enable them to undercut prices of foreign competitors in markets abroad. The practice of "dumping" became widespread. Germany was thus enabled to readjust its economy at the expense of British and U.S. exports.

Interest in international trade and affairs in the United States was at a low ebb, perhaps because the depression and its attendant internal dislocations were more severe there than elsewhere. Determination to do something about the crisis (officially termed a "national emergency") was strong. Falling prices were almost universally selected as the chief culprit. There was the belief that stringent international agreements at that time, especially with respect to exchange rates, might jeopardize the national recovery program.

When the world situation had become so involved in

1933 that a world economic conference was held in London to see what could be done about restoring equilibrium exchange rates, the United States would make no definite commitments. It also withdrew from discussions of trade agreements. The Conference broke up in utter confusion, to be followed by programs of bilateralism and self-sufficiency in the participating countries. Nevertheless, from 1934 to 1939 the United States negotiated some 30 "reciprocal trade agreements" with other countries. These reduced its tariff rates on certain items in exchange for complementary easing of restrictions.

Meanwhile, the end of German reparations payments in 1932 precipitated growing economic disorganization in France. Devaluation of the British pound and the U.S. dollar adversely affected French foreign trade. After the resumption of the gold standard in 1926, French exports had declined continuously, until in 1936 their value was the lowest since World War I. The struggle to maintain the gold parity of the franc was founded upon a fear of devaluation engendered by postwar experience with currency inflation. In Sept. 1936 the five-month-old Popular Front administration capitulated to the external economic pressure for devaluation and revalued the franc. However, the outflow of gold and capital continued, and further devaluations were necessary in 1937 and 1938.

On the other side of the world during this same period, Japan was enjoying a steadily increasing trade, stimulated by currency depreciation. In and out of the "sterling bloc" as it saw fit, Japan dispersed its trade over a large territory to obtain the necessary exchange to purchase the needs for its expanding empire. The Japanese militarist government was already intent upon putting its Greater East Asia plans, blueprinted in 1927, into effect. Established economically and militarily in Manchuria in 1931, Japan retired from the League of Nations in 1932. By 1937, open warfare broke out in China, and the Greater East Asia campaign was in full swing.

Such were the conditions of "free trade" among the five leaders of the world's export-import trade during 1937–38.

The British postwar export drive was evidenced by these crated Austin cars stacked at Collyer quay in Singapore, where transport vehicles were badly needed in 1946

"Beggar thy neighbour" economic policies to alleviate domestic difficulties were popular. Governments made special concessions to other governments. Some adopted stiff measures requiring close supervision and licencing of foreign trade transactions, export and import quotas and the manipulation of exchange. Government cartels flourished as a result of high tariffs. Russia had long since forsaken the free market completely. Brazil burned its coffee and the United States plowed under its wheat. Australia, India, China and Argentina, among others, were trying to industrialize their economies. Each in its own way strove to weather the tidal wave of the engulfing economic maelstrom.

Underlying Forces.—Despite all these restrictions, a sizable world trade continued to flow in channels which indicated that fundamental principles of economic specialization were at work on an international scale. In man's struggle to obtain a living, certain basic factors must be teckoned with, whatever the system of political and economic organization at the national and at the international level.

Tea and citrus fruit will not grow in England. The United Kingdom must trade for them or go without. It is impossible to grow enough wheat in western Europe to feed the dense population without assistance from the fertile plains of Argentina, Australia, Canada, the United States and southeastern Europe. Other, more productive lines of endeavour must be found. The presence of coal and iron in the United Kingdom and Germany coupled with large, technically skilled populations living on limited land-areas and possessed of relatively large capital accumulations, made inevitable the exchange of manufactured goods by these countries for foods and raw materials produced elsewhere.

These examples merely illustrate the fairly obvious fact that differences between nations in population densities, natural resources, capital accumulation and technical skills of their people make trade between outlying areas and industrial centres of the world economically desirable. Raw materials and foods are exchanged for manufactured goods. This fundamental basis for trade had been operative for several centuries. Its importance and the geographical scope of its influence increased rapidly after 1870 as a result of technical improvements in production, transport and communication. By the beginning of the 20th century, it embraced almost all countries.

Less widely recognized, but equally important as a basis for international trade was the growth of specialization in manufacturing. World commerce is not restricted to an exchange between classes of goods—manufactures against raw materials and toodstuffs. It is really an exchange of particular commodities, highly specialized in themselves, dependent on specialized resources, and becoming more specialized every day. By 1936–38, the variety and complexity of manufactured products was so extensive that a high degree of specialization and a large volume of trade between industrialized countries themselves had developed.

Thus, on the eve of Munich, world trade was under two conflicting pressures; on the one hand, developments in mass production methods and equipment were fostering specialization and forcing manufacturers to search for ever wider markets for their products and for new sources of the raw materials from which to make them. Improvements in communication and transportation were making it more convenient for them to contact potential customers or suppliers of raw materials throughout the world and

reducing their costs of shipping products.

Opposed to these forces of trade expansion were growing walls of economic nationalism brought on by the struggle with internal unemployment, economic stagnation and the increasing fear of impending war. The large volume of international trade which continued to exist was evidence of the great strength of the economic forces underlying trade between nations.

Prewar Trade Pattern.-The total turnover of world trade (exports plus imports) was \$47,000,000,000 annually during 1936-38. World income in these years averaged an estimated \$190,000,000,000. While the trade figures ignored the international exchange of services such as insurance, banking, shipping and tourist travel, they gave an indication of the magnitude of international commodity movements and their importance in the world economy. Exports plus imports averaged \$22.40 per capita the world

The bulk of this trade was carried on by a small number of countries. These countries traded with nearly all the remaining countries, most of which did little other trading. In addition, the leaders carried on an extensive commerce among themselves. Twenty-five countries accounted for four-fifths of the world's trade (Table I). The United Kingdom was first in imports, second in exports

^{*}Excludes gold exports valued at approximately \$27,000,000 per month.

Note: In general, exports are valued f.o.b.; imports, c.i.f. Export figures for Argentina, Australia, British India, Mexica, New Zealand and the United Kingdom include re-exports. Import figures for Australia, British India, New Zealand and the United Kingdom represent general imports. In general, data include shipments of munitions, government stores and U.N.R.R.A. supplies.

and first in total foreign trade. Although the United States ranked first in exports, relatively lower imports gave it second rank in total trade. Germany, France and Japan were third, fourth and fifth respectively. Together these five countries accounted for 45% of the world total.

A great variety of goods entered into prewar international trade. Nearly every conceivable product was represented. Over half the trade, however, was concentrated in a relatively limited number of commodities-about 25 -comprising foodstuffs, raw materials and manufactured goods. Principal foodstuffs included wheat and wheat flour, sugar, butter, coffee, meat, tea and rice. Cotton, coal, crude petroleum, gasoline and fuel oil, wool, tobacco, copper and rubber were the raw materials which led in total value of trade. Among the more important manufactured goods were machinery, iron and steel mill products and their manufactures, textile fabrics, chemicals, automobiles and paper and paper manufactures.

Three-fifths of the world's trade in commodities was in the exchange of food and raw materials for manufactured goods between industrialized and nonindustrialized countries (Table II). The definition of an industrial country

Table II.—Prewar Trade Between Industrialized and Nonindustrialized Countries (1938 annual values in millions of U.S. dollars)

Flow of Exports:	Value of 1938 Exports	Percent of World Exports
Exports of 12 Industrial Countries: To each other	6,800 6,600	31 30
Exports of Nonindustrial Countries: To industrial countries To each other Total exports 109 countries	 7,100 1,500 22,000	32 7 100

Note: The 12 industrial countries include all countries for which exports of semi-and finished manufactures were more than 50% of total exports. Those included are Bel-gium, Czechoslovakia, France, Germany (including Austria), Italy, Netherlands, Sweden, Switzerland and the United Kingdom in Europe; plus Canada, Japan and the United

varied with the point of view, of course. Nearly all countries were engaged in the local manufacture of some products, even though their imports were nearly all of manufactures and their exports of foods and raw materials. The countries selected here as industrialized were active in manufacturing for export markets as well as for domestic consumption. They include all countries which had more than 50% of their exports in manufactured goods.

Source, Values for raw materials and foods are from Network of World Irade, League of Nations (Geneva, 1942). Values for manufactures (marked *) were compiled from the Foreign Commerce Year Book, U.S. Department of Commerce. Raw material and food values cover all countries, values of manufactured goods include only exports of the 25 leading countries of world trade. Countries listed for raw materials and foods are arranged in alphabetical order; those listed for manufactures (marked *) are arranged in the order of their importance. In general, the countries listed for each commodity cover 75% or more of total world exports of the commodity.

[†]Jan. to May 1946.

LJan. to June 1946.

The Dutch vessel "Prins Maurits" which completed its first postwar voyage from Holland to Chicago, Ill., in July 1946, is shown being loaded with a return cargo of tires

Nearly all the leaders of world trade during 1936–38 were industrial countries. With the exception of British India, the first ten were in this class. Geographically there were three regions of industrial concentration: the United Kingdom, Germany, France, Belgium, the Netherlands, Italy, Sweden, Czechoslovakia and Switzerland in Europe; the United States and Canada in the western hemisphere; and Japan in the far east. These countries were all in the temperate zone of the northern hemisphere.

Although all these countries produced a fairly wide range of manufactured goods, each had particular specialities in which it enjoyed recognized superiority. The United States, for example, was famous for its automobiles, the United Kingdom for its high-grade textiles. Germany was renowned for its optical goods and chemical industries, and so on down to the smallest, Switzerland, for its watches.

Leading producers of food and raw material exports were more widely distributed over the earth's surface than were manufacturers. This was partly because a number of industrialized countries were also important suppliers of certain raw materials. Cotton, the world's leading raw material export, was shipped by the United States as well as India, Egypt and Brazil. Coal was shipped by the United Kingdom and Germany. Crude petroleum, wheat, tobacco, copper, maize, iron ore and silk were among other leading raw materials shipped by both industrialized and nonindustrialized countries. A list of the leading commodities in world trade and the countries exporting them in the largest amounts is shown in Table III.

Trade among the industrial countries themselves was an important part of the pattern of prewar world exports.

The size of this trade—\$6,800,000,000 of exports in 1938—belied the fears expressed by some that the trend toward industrialization in raw material and food producing countries would be injurious to the future trade of already industrialized countries. For one thing, many industrial countries continued to supply important raw materials and foods. The United States led the world as a supplier of cotton, tobacco and maize; the United Kingdom and Germany, coal; France, wines and liqueurs; Japan, raw silk; Canada, wheat, metals and minerals; and so down the line to Swiss cheese.

An important trade in manufactured goods also existed between the 12 industrial countries. This trade showed that there was a place for international specialization even in manufacturing. Superior products and increased productive efficiency resulted. Purchasers of industrial equipment were able to select machines which met their particular requirements. Consumers had available a wide variety of products from which to choose those satisfying their individual tastes and incomes.

Historically the industrialization of a country had always been accompanied by an increase of its foreign commerce. Imports as well as exports grew when industrialization was not "forced" artificially. As long as the country's natural resources remained undepleted, it continued to supply its particular raw materials and foods to other countries. And the increased incomes resulting from improved efficiency enabled it to import more of the foods and raw materials with which it was not supplied, as well as more varied types of manufactured goods. The spread of industrialization brought with it some changes in the relative importance of particular commodities and particular countries in world trade. Generally all gained, although not equally. From a world point of view, this was

quite acceptable as a normal consequence of economic progress.

Four Major Trading Areas.—The existence of an overall pattern of world trade during 1936–38 is clear from the above discussion. It would be a grave mistake, however, to assume that the world was one great market place in which all buyers and sellers were equally free to move from place to place to transact their business. Within this over-all pattern were several more limited patterns or "spheres of economic influence." These resulted in part from economic factors such as distances and transportation costs, in part from differences in languages, traditions and customs. Political considerations also had their influence. Four major trading "areas" existed, each led by a top-ranking industrial power.

United States.—Measured by the value of trade, the U.S. "area" was the largest, although the lines of demarcation were less clear than for the others. With some danger of oversimplification, the trade could be briefly summarized as one of exports chiefly of manufactures to Canada, Latin-American countries and the far east. Imports from these areas were largely of raw materials and special foods such as sugar and coffee. The United States had an export balance with Canada; an import balance with most Latin-American countries. In the far east it had an export balance with Japan, Australia and New Zealand, and an even larger import balance with such countries as British Malaya, India, Ceylon and the Netherlands Indies.

On the export side, trade was supplemented by extensive exports of cotton, tobacco, petroleum and petroleum products, wheat, maize and a variety of semi-finished and finished manufactured goods to the United Kingdom, France, Germany, the Netherlands, Belgium, Italy and other European countries. Although the United States also imported from European countries, its merchandise export balance to this area was large.

While the United States was the chief customer and supplier of most Latin-American republics, the United Kingdom, Germany and other industrialized European countries also relied to some extent upon this area for supplies of raw materials and food, and found in it a market for their manufactures. This was particularly true in Argentina, where the United Kingdom outbought and outsold the United States, and Germany ran third. Elsewhere Germany sold about half as much as the United States and about twice as much as the United Kingdom. Its purchases were about equal to those of the United Kingdom and approximately one-fourth those of the United States. Japanese trade in this area during 1936–38 was relatively unimportant.

Over 60% of Canada's imports were from the United States, whereas the United Kingdom supplied less than 20%. Its export trade was more evenly divided between the two countries, however, with 41% going to the United Kingdom and 34% to the United States. The remaining trade was widely dispersed.

In the far east, the United States held a far less commanding position. Only in China did it hold first place in both exports and imports, and this position was closely contested by Japan, Germany and the United Kingdom. Japan's chief supplier was the United States, from which it received raw cotton, metals and machinery. On the export side, however, Japan's chief customer was Korea¹; the United States, with large purchases of raw silk, was second. In British Malaya, the United States also took a leading

position as a buyer of rubber and tin.

United Kingdom.—The British trading system was founded on the United States as its chief single supplier. Shipments of raw cotton, tobacco, wood, food and machinery received from the United States made up 12% of the United Kingdom's imports. However, the bulk of Britain's imports—40%—was obtained from "British" countries. Canada, Australia, India and New Zealand were the leaders. With most of these countries except the Union of South Africa, Britain had large net import balances. These were offset by "invisible" items in the balances of payments such as income from foreign investments and shipping charges. Because of Britain's limited terrain and consequent concentration on manufacturing, foods as well as raw materials were important among the commodities received.

The remainder of the United Kingdom's imports were obtained chiefly from European countries and the American republics, particularly Argentina. Again food was as important as raw materials in dictating the distribution of trade. Denmark and the Netherlands sent butter and eggs to England. Germany and Sweden shipped paper and wood. France, European Russia, Ireland, Belgium and Finland were also important suppliers. The proximity of these countries to England and the nature of this trade was reminiscent of the truck farming and industrial subcontracting developing around large cities.

All told, northern and western European countries provided more than 20% of British imports. In this area Britain was in direct competition with Germany for supplies. The two were almost always the first and second ranking customers with some other country; frequently the United States was a poor third. Usually the United Kingdom held first place. Its total purchases were nearly double the value of Germany's.

On the export side, England's largest markets were in the so-called "British" countries which took nearly half of its total exports. Australia, India and Canada were the leading customers. Taken individually, the export trade with northern and western European nations was not important. The largest value was \$103,000,000 annually to Germany (fifth in rank). Nevertheless, this group of countries combined accounted for one-fourth of total exports and constituted the second largest area of British trade. Again Germany and the United Kingdom were in competition, with Germany holding a slight edge for exports to the group as a whole. Germany's lead was largest in the Netherlands and Sweden; the United Kingdom's in Denmark. Important individual countries in other parts of the world were the United States, third, with 5.2% of total United Kingdom exports; and Argentina, eighth, with 4.0%.

Germany.—Germany's first eight customers were in northern and western Europe. The Netherlands, the United Kingdom and Italy were most important. The United States was ninth. Its Latin-American export markets trailed far behind, led by Brazil in 10th place, and Argentina in 11th. Imports were obtained from a wide variety of countries, some of them industrialized, other agricultural. The United States and the United Kingdom were the two leaders. No single geographic region was a dominant source, although northern and western European countries supplied the largest proportion of the total, 37%.

The "Drang nach Osten" was producing results. Between 1936 and 1938, the export-import trade with southeastern Europe increased sharply. However, this trade remained relatively small compared with the total. In 1938, the most important countries of the group, Rumania and

Treated as separate customs area in this article.

Czechoslovakia, ranked 9th and 11th in exports; and 11th and 9th in imports respectively. In these countries Germany held the dominant position in export-import trade; the United Kingdom or the United States was usually the nearest competitor.

German imports from North and South America also increased sharply. In part this was because of stockpiling, in part because of increased raw material and food consumption accompanying expanded industrial activity in armament and other lines. Shipments of mineral oils, ores, copper, iron and steel scrap, machinery and automobiles from the United States, its chief supplier, increased manyfold.

Japan.—Japanese trade was primarily the trade of a single industrialized country with a number of less developed agricultural and raw material producing countries. In this respect it differed from the trade of other leading powers. Although the highly-industrialized United States was its chief supplier and second largest customer, in normal years this trade was largely an exchange of raw materials—silk for cotton. Korea, Manchuria (including Kwantung) and Formosa were its other chief customers and suppliers. Together they took 46% of the exports and provided 34% of the imports. In these markets Japan had undisputed supremacy.

Other major trading markets were India and Burma, China, the Netherlands Indies, Australia and British Malaya—all countries in the far east. Leading export markets were generally important supply sources and vice versa. In these countries Japanese trade was usually exceeded in value by that of the United Kingdom, the United States or both. Trade with non-Pacific countries during 1936–38 was relatively small and widely dispersed. There were sizable exports to Britain and imports from Germany.

Textile yarns, fabrics and clothing led the list of Japanese exports. Raw silk was also important. Large shipments of machinery and metal manufactures were made to such countries as China, Formosa, Korea and Manchuria. Raw cotton and wool, metals and ores, and rice were among the leading imports. Like Germany, Japan carried on a considerable stockpiling program during 1937 and 1938. Imports of raw cotton from the United States were reduced, and the foreign exchange was used to obtain metals and scrap iron, machinery and oils.

The Line-Up.—At the outbreak of World War II, the United States held a predominant position in the trade of the entire western hemisphere. It shared the trade of the Pacific far east with Japan and the United Kingdom. In addition, it had a considerable export and somewhat smaller import trade with industrialized countries in Europe. The United Kingdom's sphere of economic preference was in the so-called British countries. The exportimport trades of India, Australia, New Zealand, the Union of South Africa, Burma and Ceylon were largely with the United Kingdom. Northern and western European countries were a second important group. Here the competition with Germany was particularly keen.

Germany's chief trading area was in northern and western Europe (including Italy). Commerce with Latin America was small, but growing. In eastern and southeastern Europe, Germany's position as a leader was firmly established, although the value of trade was small.

Japan had virtually a complete monopoly of Korean and Formosan trade and an overwhelming dominance in the trade of Manchuria. Its considerable trade with other far eastern countries was usually in competition with the United Kingdom and the United States, particularly in

China. In the occident, its chief trade was the exchange of raw silk for raw cotton with the United States. Exports to Britain and imports from Germany were also important.

When Germany marched into Poland in Sept. 1939, "Deutschland über alles" was still just a melody in the economic sphere. Britain's internal and overseas agricultural, mineral and industrial resources alone were superior to Germany's. When the resources of the United States were also considered, ratios became meaningless. The Germans knew this. Economic as well as military strategy dictated the "blitzkrieg." The Germans expected

First postwar shipment of raw silk from Japan being unloaded in April 1946 at the Seattle, Wash., port of embarkation

to win before the superior economic resources of their potential enemies could be mobilized for war.

Forging the Weapon of Foreign Trade.—How the Allies used close co-operation in the field of foreign trade to help them win the war was clearly portrayed in the statistics of their wartime imports and exports. Geographic and labour specialization were employed to the "nth degree." Space and time were almost annihilated; a bridge of ships was built to carry the tremendous flow of supplies and matériel.

Each country played its part. The specialization of the United States and Canada on the industrial production front was spotlighted by unprecedented increases in their exports. U.S. exports during 1942–44 averaged \$11,800,000,000—four times their 1936–38 average. Canada's exports for the same years tripled. While part of each rise was due to price increases, the physical quantities of exports of both countries more than doubled. And this was exclusive of shipments by either country to its own armed forces abroad.

Rapid expansion of production naturally increased raw material consumption. The part played by the Latin-American republics was complementary to the industrial production of the United States. Food and raw materials such as metals, fibres, nitrates and petroleum were supplied in ever-increasing amounts. Exports during 1944 were 72% higher than in 1938. The Latin-American republics also cut down on imports for consumption. Because of the supply situation for manufactured goods, the value of imports of these countries remained at prewar levels or below, except for 1944.

In keeping with Britain's proximity to European fighting fronts and its specialization on munitions production in accordance with the lend-lease agreements, the United Kingdom's total export-import trade declined considerably. Imports rose, but not enough to offset the decline in exports. For 1943-44, imports averaged \$5,100,000,000 (1942 was low because of submarine losses). This was 12% above the 1936-38 average. In contrast, exports averaged \$1,020,000,000-some 62% below 1936-38.

In the Pacific, the role of foreign trade in helping to win the war was less clearly defined in the statistics; for one thing, there were fewer reliable statistics. Australian imports increased somewhat; exports were considerably below prewar levels in most years. The total trade of British India declined—exports more than imports. Like the United Kingdom, these countries were closer to fighting fronts than were the western hemisphere countries, so their trade reflected the effects of intensive defense preparations and lend-lease imports.

Thus the Allies' wartime trade was founded on familiar principles. Developments in mass production techniques and improvements in transportation, twin forces which had been driving the world toward a single economy even before the war, received a tremendous impetus. Although manufacturing countries found some synthetic sources of raw materials and raw material countries developed some manufacturing, on the whole the interdependence of countries appears to have increased during the war.

Before this close co-ordination of industrial production, civilian consumption and military supply could be achieved on an international scale, a number of political and organizational problems had to be solved. Not until lendlease was enacted did a sound basis exist upon which a unified interallied war economy could be established. Until this time the Allies stumbled along after Munich, improvis-

ing devices to meet pressing difficulties as they arose. The United States did not even know it was in the war.

The change in U.S. policy from strict neutrality to all-aid-short-of-war was gradual and fraught with the sharpest controversy. The Neutrality act of 1935 and its subsequent amendments had placed an embargo on the shipment of arms, ammunition and instruments of war to any belligerent. Two months after the outbreak of war between the major European powers, this act was repealed and the "cash and carry" system was instituted. Ships flying the U.S. flag were still prohibited from carrying exports of munitions, however.

As a direct result of this change in sentiment in the United States, the British Purchasing commission was organized for the purpose of buying war supplies in that country. The French, Chinese and Russians also established purchasing agencies in the United States. Contracts for war materials and equipment were placed directly with private producers. In many instances the contracts provided for financing the construction of facilities as well as the purchase of production once these facilities were in operation. Originally these orders were placed primarily as insurance against unexpected losses, but gradually, as the impact of war became more acute, they assumed tremendous proportions.

The increasing demands of belligerents upon U.S. supplies of raw materials and military equipment were fast depleting its national resources in 1940. Defense planners in that country watched with deep concern as the very materials and equipment they needed themselves left the country. Efforts to control exports by means of "moral embargoes" to prevent shipments of certain materials and equipment, particularly machine tools, met with little success. In June 1940 the Rubber Reserve and the Metals Reserve companies were set up under the authority of the Reconstruction Finance Corporation act to conserve and replenish stockpiles of strategic materials, many of which were obtained from overseas sources in danger of being cut off. On July 2, 1940, congress passed "An Act to Expedite the Strengthening of the National Defense." This act granted the president authority to prohibit or curtail the exploration of military equipment, munitions or components thereof; and machinery, tools and materials necessary to manufacture, operate or service such machinery.

Latin-American countries were also affected by the outbreak of war. Valuable sources of supply and markets for home goods diminished as one European country after another fell under the nazi blitz. A conference of ministers of foreign affairs of the American republics held in Sept. 1939 was followed by subsequent meetings at irregular intervals. The United States undertook to provide the import requirements of these countries in adequate volume to maintain their economic stability in return for assured co-operation in defense preparations and in supplies of raw materials. In July 1940 congress passed the Pitman act, which provided for the procurement of arms and implements of war for South American countries. To assist in the prevention of shipments to axis countries, export controls were enacted by many of the American republics. Import controls were adopted to assure a satisfactory distribution of the limited supplies of foreign goods available.

A Canadian-U.S. Joint Board on Defense was inaugulated at Ogdensburg, N.Y., in Aug. 1940. A further basis for economic collaboration between the United States and Canada was established in April 1941 by the Hyde Park agreements. Specialization in production and exchange of defense materials were provided for. Trade between the

two countries was exempted from export controls. This was followed in May 1941 by a Material Co-ordinating committee comprised of representatives from the U.S. Office of Production Management (later the War Production board) and the Canadian Wartime Industries board.

In the United Kingdom, controls were established over imports, exports and foreign investments and balances. Shortly after Britain's declaration of war, the ministry of economic warfare was formed, to plan and administer all activities designed to injure the axis economy. The "paper blockade" together with the destruction of the axis' strategic industrial facilities were its chief weapons. In developing the blockade, M.E.W. necessarily solicited the aid of the dominions and neutrals. The British Export council was organized in the spring of 1940 to implement a drive to expand exports for the purpose of obtaining foreign exchange. The magnitude of Britain's import requirements for military purposes and the need for diverting internal production to military channels, however, soon made it clear that this was not a satisfactory solution. As foreign balances dwindled, outside assistance became imperative.

To maintain the pipe line of tanks, guns and planes to Britain was of prime importance to the defense plans of the United States. Experience after World War I had shown that a loan was not the solution. The plan finally evolved was simple. The U.S. government would place all contracts for war goods to be manufactured in the United States. What was essential for the defense machine would remain at home, what would be more useful to the defense of the United States if used in Great Britain could either be leased or sold subject to mortgage to the people on the other side. British industry could concentrate on military production. By subsequent agreement, exports involving materials received by Britain under lend-lease could not be shipped without previous consultation with the United States. The British Export council was reorganized into the Industrial and Export council, and its attention was focused on the development of war and home civilian production. The congressional act of March 11, 1941, provided the means to furnish "defense articles" in any manner to the government of any country whose defense the president deemed vital to the defense of the United States. Thus, in retrospect, lend-lease became the cornerstone upon which the structure of Allied teamwork was subsequently built-the mechanism through which the United Nations were later to pool their entire resources for the winning of final victory.

During 1941, productive capacity in the United States was still not fully utilized, and considerable unemployment remained. Furthermore, production in nonessential consumers goods lines continued to draw upon supplies of critical war materials. With the United States' entry into the war, however, military production sights were raised and the United States geared itself for war production in earnest. To provide for collaboration on the military and industrial production fronts, a number of U.S.-British boards were established. (See British-U.S. War Boards.)

Wartime World Trade

The Japanese attack on Pearl Harbor divided the world into three areas almost entirely cut off from each other by force of arms. The size of the regions and the volume of trade within them became dependent on the fortunes of war. A few countries remained technically neutral, among them Sweden, Switzerland, Spain, Portugal and Turkey; their trade, however, was guided by the political pressures of belligerents and by the possibilities of transportation

Table IV .-- United States Lend-Lease Aid by Country

The extent to which foreign trade was disrupted by the war situation in 1943 is shown in Table IV. About \$20,000,000,000 in exports and imports (about four-ninths of prewar world trade) which normally flowed between the three regions (1938) was cut off. In the Allied region, which comprised North and South America, Oceania, parts of Africa and Asia, the United Kingdom and the U.S.S.R., this loss of trade was more than offset by the tremendous expansion of trade between the Allies. Such statistics as were available indicated that no such growth of intraregional trade developed in the areas under German and Japanese domination.

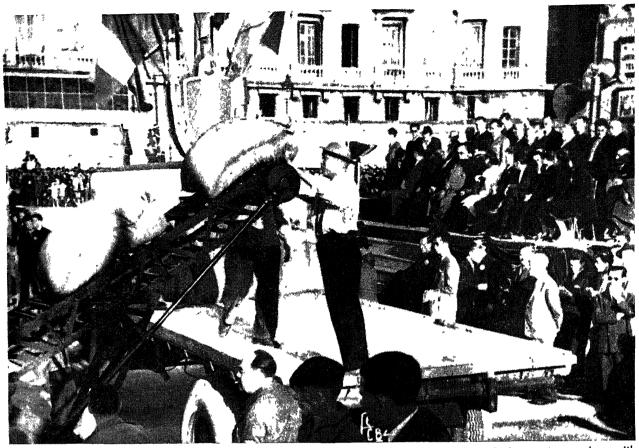

The Cornerstone: U.S. Trade.—The wartime export movement from the United States reached its peak, in terms of dollar values, during 1944. Lend-lease exports rose to \$11,300,000,000 and total exports to \$14,300,000,000. These were exclusive of supplies destined for the armed forces of the United States in foreign countries.

Higher prices contributed to the increase in value of U.S. foreign trade during the war, of course. The exact amount of the price rise was difficult to determine since many new commodities entered into the wartime trade. Estimates of the U.S. department of commerce indicated that export prices were about 67% higher in 1944 than in 1936–38. The volume of goods shipped in 1944 was roughly three times the annual shipments during 1936–38 and double the prewar peak of 1929.

Even as early as 1939, total U.S. exports began to expand under the impetus of war orders. Under the terms of the arms embargo such shipments were limited to industrial equipment (such as machine tools), raw materials and supplies. When the arms embargo was repealed and the "cash and carry" system instituted, orders and shipments of combat weapons pyramided. This system favoured exports to Britain because it had the ships and large foreign investments which could be liquidated to obtain dollars. Considerable exports were also made to France.

By the fall of 1940, Britain's foreign balances were becoming exhausted. Canada, India, Australia and New Zealand were accepting credits in London in return for their exports. Some method had to be devised if the flow of munitions from the United States to the United Kingdom was to be maintained and England kept in the war. Lend-lease was the answer.

Lend-Lease Exports.—With the adoption of lend-lease, all military procurement in the United States was centralized under the government. Direct purchases of military equipment and strategic materials by foreign governments came to an end, and a new category, "lend-lease shipments," appeared in the U.S. export classification. The Lend-Lease administration was set up to determine foreign requirements, act as claimant-agent in allocation meetings and arrange for shipments.

First shipment of Russian wheat and barley sent in accordance with a Franco-Soviet agreement to help relieve the French bread crisis, is shown arriving at Marseilles in April 1946. The occasion was observed by ceremonies at the dock

After a certain amount of delay while orders were being placed and pipe lines filled, shipments began to expand rapidly. In 1944, they reached \$11,305,000,000 or 80% of total exports. During the four and one-half years in which the lend-lease program was in operation, the United States exported goods valued at \$33,000,000,000 to the Allied nations. Geographically, 42% went to the United Kingdom, 29% to the U.S.S.R., 10% to Africa and the near east, and 12% to the far east (chiefly China). The remaining 7% represented supplies destined for western hemisphere countries, including those which Canada procured through lend-lease facilities but paid for. Goods procured by the United States in other countries for lend-lease shipment, and shipping and other charges brought the total to \$49,096,000,000 as of Dec. 31, 1945 (Table V).

Table V.—World Trade Interrupted by the War (In millions of U.S. dollars)

Groups of Countries	Total Turnover (Exports plus Imports) in 1938	Trade Interrupted by the War	Percentage of Trade Cut Off
Continental Europe	 17,400	8.000	46
Rest of Europe	 6,800	2,400	3.5
United States	5,000	2,100	42
Rest of North America	 1,600	200	13

Source "Annual Report" of the Bank for International Settlements, published in Federal Reserve Bulletin, Sept. 1945.

The full economic significance of this phenomenal growth of exports is missed until we realize that combat equipment and ammunition were only a small part of the staggering total. Industrial machinery, motor vehicles and

parts, metals, petroleum and gasoline, foods and other necessities of life made up 44% of the shipments. And the munitions class itself included a large proportion of civilian type items such as radios and telephones, merchant ships, cargo planes, construction equipment, shoes and other military clothing, and medical supplies. Lend-lease was the key which unlocked the tremendous productive capacity of the United States and interlocked the economies of the Allied nations.

Exports to Western Hemisphere.—The other arm of overseas co-operation was the trade of the United States with western hemisphere countries. This trade consisted chiefly of the supply of raw materials and foods to the arsenals and factories of the United States in return for machinery, manufactured civilian goods and some military equipment. Customary methods of financing (i.e., non-lend-lease) were adequate for the conduct of this trade because it involved a two-way exchange of goods. In fact, the United States had a considerable import balance with the American republics.

During the first two years after the outbreak of World War II, exports from the United States to the American republics increased as Latin America turned to the United States to replace supplies formerly obtained from Germany, now virtually ruled from the seas. During 1941 they totalled \$902,000,000 compared with an annual average of \$486,000,000 in 1936–38. With the entry of the United States into the war, these exports declined. Shortages of goods and shipping facilities, plus the submarine menace, were responsible. Not until 1944, when merchant ships were sliding down United States shipways at the rate of

71:

three or four a day and the submarine menace had been conquered did they recover their 1941 value. And this recovery was chiefly because of price increases—physical quantities were still below even their prewar levels.

In contrast, exports to Canada increased rapidly right after the start of war and continued to do so through 1943, when they were \$1,444,000,000—more than three times their prewar value. These exports were more directly related to military production and procurement than were those of Latin America. Among important products shipped were aeroplane parts and other munitions components. Some of these shipments were procured through lend-lease facilities with arrangements for reimbursement of the United States.

U.S. Imports.—On the import side, U.S. trade showed the influence of two developments: (1) the loss of supplies from axis and axis-occupied territories in Europe and later the far east; and (2) the development of alternative sources of supply in Canada, Latin America, Africa and the near east. During the two years before Pearl Harbor, the United States built up stockpiles of such critical war materials as rubber and alloy metals. The preclusive buying program also contributed to the expansion of imports. Imports from Africa and the near east were double their prewar value in 1941; those from the American republics nearly double. Shipments received from Canada increased 61%; those from the far east 58%.

The wisdom of stockpiling was proved in 1942 when, one after another, important sources of raw materials in the Southwest Pacific fell into Japanese hands. United States imports from the far east dropped to 44% of their 1941 value and continued to decline for the rest of the war. The need for shipping in the North Atlantic and the ravages of submarine warfare also held down 1942 imports from the American republics. Total U.S. imports in 1942 were only 10% above their 1936–38 average value; in physical quantities they were about 8% below prewar levels.

Imports from Canada and the American republics increased rapidly during the next two years. By 1944, these countries supplied nearly three-fourths of U.S. imports; in that year, total imports reached \$3,900,000,000—a value higher than in any year after 1929. Import prices were about 50% higher than during 1936–38. The actual volume of goods received, therefore, was only about 5% above the immediate prewar years.

Imports exceeded non-lend-lease exports in 1944 by approximately \$900,000,000, of which \$600,000,000 was accounted for by trade with the American republics. This feature of U.S. wartime trade stood in sharp contrast to the typical excess of exports in prewar trade and was a principal factor accounting for the increase in foreign holdings of dollars and gold during 1944.

The wartime trade of the United Kingdom, Canada and the American republics reflected the phenomenal growth of U.S. trade. United Kingdom imports increased 50% despite the loss of supplies normally received from axis and axis-occupied countries. Latin-American exports nearly doubled even counting in the loss of European markets. Canada's trade increased on both sides.

Wartime Trade of the United Kingdom.—The outstanding feature of British wartime trade was the drastic reduction of exports and tremendous expansion of imports. Dictated by the fortunes of war, this change was accomplished only by liquidation of foreign balances and investments and the incurrence of large foreign debts. From a leading creditor, England was converted into a debtor nation, a change which was to have a profound influence upon the

development of postwar world trade.

Throughout the five years from 1940 to 1944, British imports exceeded exports by an annual average of \$3,400,000,000—nearly twice the prewar amount. Of this total, \$2,500,000,000 was in Britain's trade with the United States, Canada and the American republics; \$900,000,000 was with other unoccupied countries. Before the war the excess of imports from western hemisphere countries, excluding British colonies, amounted to only \$960.000,000 annually. Under the circumstances, it was not difficult to understand how British resources dwindled and obligations piled up.

The declaration of war in Sept. 1939 and the subsequent axis occupation of one after another country in Europe and later Asia, cut off from a fourth to a third of England's prewar export markets. Shortages of goods and shipping facilities, and prohibitions on the export of goods made from lend-lease materials, brought exports to the American republics in 1944 down to less than a fourth of their prewar dollar value, despite higher prices. Exports to other areas such as Africa, the middle east and Oceania fared somewhat better. The United Kingdom shared with the United States the task of supplying the essential requirements of countries in these areas. Total exports reached their wartime low in 1943. In this year they were only two-fifths of their 1938 dollar value and less than one-third their prewar physical volume.

Even before the war British imports were nearly double the value of exports; in 1944 they were five times as great. The 1944 peak was 14% above the average annual dollar value from 1936–38. Measured in English pounds sterling, the increase was 40%. Since prices had risen considerably more, however, the actual volume of merchandise received was below prewar levels. Quantities of food, animal feed-stuffs and raw materials imported were curtailed by an estimated 50% as compared with prewar levels, while imports of finished goods were largely confined to munitions.

If this comparatively low level for the physical volume of United Kingdom imports seemed a disappointing achievement in view of the herculean export efforts of the United States, Canada, the Latin-American republics and other countries, two things should be remembered. First, the battle of the Atlantic was extremely costly. Submarine losses, not included in the British statistics, were large, especially in 1942 and early 1943. Second, Britain's chief prewar import sources were cut off by the war. In 1936-38, the United States, Canada and the American republics together supplied only 30% of the United Kingdom's imports. By 1943 these countries combined supplied 69% of the total; in 1944, 67%. This tremendous shift was possible only because of U.S. lend-lease, Canadian mutual aid and the acceptance of sterling credits by Latin-American republics.

Canada's Wartime Trade.—Canadian exports rose almost on a par with those of the United States. In 1944 they were \$3,100,000,000—almost four times their 1936—38 average. In comparison, the value of U.S. exports increased nearly fivefold. Like the United States, Canada made heavy shipments overseas, especially to the United Kingdom, as a part of the mutual aid arrangements among the United Nations. Nearly a third of Canada's wartime exports were financed by loans and grants in aid. In 1942, sterling balances accumulated by Canada during the early war years were funded by a loan of \$700,000,000 to the United Kingdom. An outright gift (mutual aid) of \$1,000,000,000 for financing exports to the United Kingdom was

made in the same year. During 1943-44 this was followed by appropriations for mutual aid amounting to \$1,800,000,000.

Early in 1942, however, the United States took over the United Kingdom's prewar position as Canada's number one customer; it continued to hold this spot after the war. Between them, these two countries alone took three-fourths of Canadian exports in 1944, the same as the prewar proportion.

Imports into Canada were at a record level in 1942. In subsequent years the increase was slight. The 1944 peak of \$1,585,000,000 was two and one-half times the prewar level. A fair estimate of the interim price increase was 45%. On this basis, the physical quantity of imports could be estimated at 70% above prewar levels. Practically all of the increase, and indeed 82% of the total, constituted shipments from the United States. These included some lend-lease deliveries for other than Canadian account, such as components of munitions eventually going to the United Kingdom.

Latin-American Republics.—The chief developments in the wartime trade of the American republics were the increase in their exports to the United States and the rapid growth of their trade with each other. These factors brought total exports to \$2,960,000,000 in 1944—an increase of 72% over 1938. Exports to the United States tripled; trade among the republics increased almost five times. Shipments to the United Kingdom also rose more than 60% in value. Continental European markets were largely cut off throughout the war.

The American republics helped to replace sources of critical raw materials cut off by the war. Among important war materials shipped were copper, nitrates, rubber, tin, mica, sisal and henequen, hides and skins, industrial diamonds and vegetable oils. In the food class, sugar, coffee, meat and grains were important.

By mutual agreement of the United Nations, the United States undertook to supply the import requirements of the Latin-American republics after Pearl Harbor. Latin-American imports from the United States had already expanded in 1940 and 1941 to replace those cut off from Germany and to a lesser extent the United Kingdom. Shortages of goods in the United States and lack of shipping space, however, combined with submarine losses to hold down imports during 1942. Not until 1944 did total imports of the American republics show any noticeable increase over their prewar value. In this year, imports from the United States surpassed their 1941 value for the first time and were more than double their 1938 value. However, total imports were only 30% above the 1938 value, so the quantity of merchandise received was still considerably below prewar levels. Indeed, if imports from other American republics were eliminated, imports from the rest of the world were only 4% above their prewar value.

Whenever possible, the United States attempted to provide machinery and equipment for the expansion of production of raw materials and even manufactures in critically short supply. The success of this program was indicated by the expansion of exports of raw materials to the United States and the development of an exchange of manufactured goods for raw materials among the American republics themselves. In 1944, the export-import trade between the American republics totalled nearly \$1,000,000,000.

Because of the necessity of going without imported goods,

the gold and foreign exchange holdings of the Latin-American countries increased throughout the war. At the end of 1944 they were an estimated \$3,500,000,000. The excess of exports over imports in trade with the United States accounted for a large part of this balance; sterling balances likewise increased. Import controls were instituted by most of the republics to insure the desired distribution of the limited supply of goods available. Export controls were also adopted to prevent direct and indirect shipments to axis nations.

Transition

Events of momentous importance to the flow of international trade followed each other in rapid succession throughout 1945. At the year's outset the Allies were successfully blunting, then breaking the desperate German counteroffensive in the Ardennes. The gradual crumbling of the German armies followed, with complete capitulation of Germany on May 7. Three months later, Japan joined its two accomplices in unconditional surrender. At the year's end, however, several important trading areas still remained closed to the free flow of trade. Axis countries, of course, continued under Allied army occupation and were prohibited from engaging in foreign trade. Open fighting or an armed state of truce existed in several other areas. In many war-devastated regions transportation, communication and harbour facilities remained inadequate and production was still far below prewar levels.

During the first half of 1945, trade between the Allies continued much as it had in previous war years. Shipments of military equipment continued to decline as they had in the last half of 1944 after completion of preparations for D-day. The reopening of trade between liberated countries on the continent and the United Kingdom and western hemisphere countries was the chief new development. V-J day changed all this. Strenuous efforts by all countries to reconvert their foreign trade as well as their domestic production to peacetime channels characterized developments during the last half of 1945.

The wartime trends in the exports and imports of the various countries described above were quickly reversed (Table VI). The termination of lend-lease on Aug. 21, 1945, signalized a decline of imports for many countries and a reduction of exports for the United States. U.S. imports declined too, as the need for raw materials diminished. By Nov. the contraction of U.S. exports resulting from the termination of lend-lease was nearly completed. Shipments of munitions were nearly down to normal peacetime levels. Although exports which were technically classified as "lend-lease" continued on a small scale, they represented transitional operations in the course of draining

"pipe lines." Increased U.N.R.R.A. and private relief shipments and an expansion of commercial trade brought exports to a total well above the Oct. low.

Canadian exports reached their low in Sept. 1945. Seasonal factors, particularly the fall grain shipments, arrested any further decline until after the end of the year. During the war Canada was the world's second ranking exporter. With winter's reversal of the fall seasonal trend, it relinquished this spot to Britain. Canadian imports remained relatively steady throughout 1945 at around \$120,000,000. After V-J day, imports from the United States declined slightly; those from the United Kingdom increased.

Imports of the United Kingdom reacted immediately to the termination of lend-lease. It was the only one of 24 countries for which Sept. 1945 data were available which showed a noticeable decline of imports. Aug. imports were nearly \$500,000,000; two months later, imports were below \$300,000,000. Soon after V-E day, imports of manufactures and munitions were curtailed; termination of lend-lease brought a reduction in imports of food as well.

Britain's export trade fared better. Shipments increased irregularly from V-E day until the end of the year. Shipments to all areas increased, especially those to continental Europe and Latin America. Not until the first quarter of 1946, however, did the postwar export drive really get under way.

Immediately after V-E day, an upsurge occurred in the trade of the 20 American republics. Exports increased rapidly, owing to the temporary easing of the shipping situation and the continued requirements of the United States for war materials. With the capitulation of Japan, munitions production in the United States declined sharply and reduced the need for raw material imports from Latin America. The reopening of trade with continental Europe, however, provided offsetting exports. Exports to the United Kingdom also increased.

After V-J day, exports were relatively stable at around \$320,000,000 per month for the balance of the year. The cessation of hostilities gave businessmen in the United States, the United Kingdom and Canada more opportunity to give attention to the needs of their Latin-American customers. Flush with cash balances accumulated during the war, and eager to buy manufactured consumers goods and industrial machinery for replacement and expansion, the American republics led other countries in the growth of their imports.

To the "big three" of world trade (United States, United Kingdom and Canada), Latin America represented a major postwar source of raw materials and foods and an important market for manufactures. Postwar developments in the relative status of these three countries in the trade

of this area could best be observed in the statistics of the American republics themselves. In Table VII, the exports and imports of three of the leading countries combined—Brazil, Argentina and Chile—are shown for the year 1945. Reconversion was characterized by a rapid growth of trade with the United Kingdom and continental Europe, although the United States maintained an overwhelmingly dominant position.

Only continental European countries surpassed Latin-American republics in the percentage growth of their trade after V-J day. This was because continental trade was just making a beginning during the first half of 1945. Trade of liberated and neutral countries alike rose rapidly; increases ranged from two- to tenfold between the first and last quarters of 1945. Food and raw material shipments were largely responsible.

Extent of Recovery in 1945.—By the end of 1945, world exports of 20 countries were proceeding at a monthly rate of \$1,600,000,000—a recovery of 30% from the Sept. reconversion low. Prewar exports of these countries were \$1,000,000,000 per month. Since dollar prices in world export markets at this time were from 50% to 55% higher than during 1936–38, even the physical movement of goods was somewhat above prewar levels.

Total world trade had not recovered by any such magnitude, however, since such prewar leaders as Germany and Japan were excluded from the 20 countries. For the world as a whole, the dollar value of trade in Dec. 1945 was about equal to the 1936–38 monthly average; the volume was estimated to be 70% of that in prewar years. The gigantic problems ahead in relief and the reconstruction of world trade were evidenced by the concentration of existing trade among the United States, the United Kingdom, Canada and the Latin-American republics. In the fourth quarter of 1945, the export-import trade of these countries with each other was double its quarterly value in the years 1936–38. Even with allowance for price increases, shipments were considerably above prewar levels, in sharp contrast to the trade of the rest of the world.

Postwar Problems.—The postwar reconstruction of world trade was complicated by a formidable number of interrelated problems. Many of these were not a direct heritage of the war, although the war emphasized the necessity for their prompt solution. Among these problems were relief, rehabilitation and reconstruction in war-devastated areas; the disposal of war equipment and property; settlement of war debts and reparations; the economic future of Germany and Japan in relation to foreign trade; the spread of industrialization to newly developed and "backward" countries; relaxation of trade controls established before and during the war, or, if these were to be retained by some countries, the development of amicable trade with controls; the establishment of an international currency, or at least of stable exchange rates; the development of a mechanism to provide sound international investment; and the ever-present fear of cyclical fluctuations with their danger of world-wide depression.

The most immediately urgent problem was relief and rehabilitation. The United Nations Relief and Rehabilitation administration was formed to assist those liberated countries which requested aid because they lacked sufficient foreign exchange to finance importations of this kind. Contributions pledged were based upon relative sizes of national income. By Nov. 1946 a total of \$3,681,000,000 was made available. Most U.N.R.R.A. shipments were to eastern and southern European countries and to China. Pri-

718 vate

vate relief agencies also made shipments to these and to other countries. The size and composition of U.N.R.R.A. shipments are shown in Tables VIII to X. (See also UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION.)

With respect to the relaxation of foreign trade controls, the Allies had widely divergent points of view. In part, these differences were based upon their diverse internal economic organizations. The United States wished to relax controls as rapidly as possible, and in fact did so soon after V-J day on all but a limited list of items in short supply. In contrast, the U.S.S.R. expected to continue its prewar government monopoly of foreign trade. Between these two extremes were the United Kingdom and most European countries, which wished to maintain both import and export controls and to conduct trade through government purchasing missions. In part these desires were based upon shortages of goods and unfavourable balances of payments. Many Latin-American countries also continued their wartime foreign trade controls.

The cancellation of any obligation to pay for most of the shipments received by Great Britain under lend-lease represented a forward-looking step in the settlement of war debts. Similar agreements were expected for the other chief recipients of lend-lease aid. Britain continued to owe large balances to its colonies, the dominions and South American countries. These were due in sterling and, by mutual understanding, could not be converted to other currencies. In effect, therefore, payment had to be accepted in terms of British goods. The liquidation of foreign investments early in the war further aggravated Britain's

balance of payments situation.

The British-U.S. loan agreement, proposals for which were first announced in Dec. 1945, was a major step in the United States drive to restore postwar international trade on a laissez-faire basis. With this financial aid, it was believed the United Kingdom would be enabled to join the United States in promoting various proposals such as the stabilization of exchange rates, the reduction of tariffs and the re-establishment of foreign investment on a sound basis. The proposed agreement provided for the authorization of new loans to the British government up to \$3,750,000,000 plus \$618,000,000 for funding of all British obligations under lend-lease. Liberal terms of repayment were established. In return, the United Kıngdom agreed to eliminate the practice of pooling dollar exchange and to allow other countries to convert their sterling balances into dollar exchange. It also subscribed to the objective of private trade under reduced tariff barriers and agreed to co-operate in the promotion of a world conference on international trade organization.

The Bretton Woods monetary agreements were formally signed shortly thereafter by 29 of the 44 nations which had drafted them in the summer of 1944. The International Monetary Fund (q.v.) was established to promote the stabilization of exchange rates, a necessary condition to the conduct of international trade on a private trading basis. The International Bank for Reconstruction and Development (q.v.) was formed to provide for long-term investment operations between countries. It was hoped that private banks and individuals might ultimately be induced to make foreign investments either directly or through the purchase of securities floated through the World bank. In the interval between the termination of lend-lease and the start of operations by the World bank, the U.S. Export-Import bank (q.v.) was the chief agency financing international investment.

The effects of the war upon patterns of international specialization and industrialization were a major problem confronting the World bank. Before the war, western European countries such as Belgium, Czechoslovakia, France, Germany, Italy, Sweden and Switzerland were among the leading industrial workshops of the world. Their imports were chiefly of foods and raw materials, their exports mainly manufactured goods. Germany led them all, exporting industrial machinery and equipment and manufactured consumer goods to them as well as to other less industrialized countries in Europe and elsewhere. Japan held a similar position in the far east.

The replacement of war-damaged productive facilities in the liberated countries was thus only part of the problem of the reconstruction of world trade. Some replacement had to be found for the former reliance placed upon Germany and Japan for industrial equipment and manufactured consumer goods by other countries. New channels had to be developed for the prewar flow of raw materials and food.

The trend toward industrialization in previously undeveloped countries was also a factor in the reconstruction of postwar world trade patterns. Some diversification of production was regarded as necessary by many of these countries to avoid the inherent economic instability involved in specialization in the production of raw materials or food.

Proposals for a conference of all nations to establish an International Trade organization were first announced by the United States on Dec. 6, 1945. In Feb. 1946 the economic and social council of the United Nations, at its first meeting, adopted a resolution calling for a similar

conference. A preparatory committee of 19 countries was established which met in London in the fall of 1946 to arrange for the conference and prepare a draft charter. Meanwhile the United States continued with negotiations for revisions of its reciprocal trade treaties with a general view to lowering tariff barriers. (See U.S. Trade Agreements, below.)

The fear of postwar depression and unemployment, and the desire of governments to be free to adopt such measures as appeared expedient to combat them, were important hurdles to the adoption of agreements concerning international trade. There was general agreement that the success of an international trade organization would require consideration of employment as well as trade policies.

Considerable experience was gained during the war with international agencies designed to solve economic and production problems. How much of this experience and the framework developed would prove useful under peacetime conditions was uncertain. Prospects appeared most promising in the field of agricultural production. The Food and Agricultural organization was established at the Quebec conference in Oct. 1945 as an outgrowth of the Combined Food board. At its meeting in Copenhagen, Denmark, in Sept. 1946 a World Food board was formed to deal with surplus and deficit food production problems. Among prewar agencies of this kind was the International Labour organization (q.v.).

Active 1946.—Although many problems of postwar economic organization remained unresolved, the first half of 1946 was a period of unusual activity in world trade. Relief shipments of food and clothing to war-devastated areas were at their peak. In late spring, evidence of another stage in the postwar development of trade—reconstruction—began to appear. Shipments of agricultural and industrial machinery, construction equipment, vehicles and manufactured consumers goods increased in importance as reconversion to civilian production gained headway in the United States and the United Kingdom.

During the first quarter, exports of the 20 countries were steady at about their Dec. 1945 level. Seasonal factors were partly responsible for the levelling off of trade. Canadian exports showed their regular winter decline resulting from the closing of shipping on the Great Lakes. Shipping in Swedish harbours also was affected by winter weather. U.S. exports began to level off, although their prewar tendency to decline in the winter months was not in evidence except in February. These declines were offset by increases in the exports of the United Kingdom and liberated countries in Europe.

The upward trend was renewed in April and May. Exports of the 20 countries in the second quarter rose to 16% above the first quarter level and to nearly double their prewar monthly value. Part of the rise could probably be attributed to further increases in export prices. Seasonal factors also contributed. Ratios to the dollar for the various currencies of the countries involved remained unchanged during the period, so the rise was not due to changes in conversion factors. The world-wide scope of the April-May increases was indicated by the fact that exports increased in all but 2 of the 20 countries.

Exports, the Yardstick.—Conditions in world markets during the first six months of 1946 were quite different from those in 1936–38. Markets were "sellers'" markets. The efforts of most nations were aimed at obtaining imports. Import controls were designed to secure the most possible in return for the limited available foreign exchange. Many nations maintained restrictions on exports also to conserve limited supplies for urgent domestic needs.

Hence the significance of exports and imports differed between countries in this period.

Nevertheless, many of the export-import regulations and controls were intended to speed up and strengthen ultimate entry into world markets as suppliers. Thus, one measure of the progress of reconversion and industrial rehabilitation in various countries was the rate of increase in their contribution to the volume of world trade on the export side. Movements of imports of the 20 countries combined were similar to those of their exports. Imports of liberated countries ranged up to four or five times exports. The United Kingdom also had an import balance. These import balances were provided by net exports from the United States, Canada and the Latin-American republics.

Postwar Leaders.—The United States, the United Kingdom and Canada emerged from World War II as undisputed leaders of world trade. Their combined exports during the first half of 1946 were 2.30 times the combined exports of the 17 other countries for which estimates were available. On the import side the ratio was somewhat lower—1.60 times. Before the war the ratio of exports for the same countries had been only 1.19 to 1; of imports, 1.23 to 1. Among the 17 other countries were such prewar leaders as France, Belgium, Australia, Argentina, Sweden, Switzerland and Brazil. The postwar dominance of the "big three" would be even more striking were Germany and Japan included in these ratios.

On the export side the gain in relative importance was due to an actual expansion of exports as well as to the fact that exports of war-devastated countries declined Exports of the "big three" were more than double their 1936–38 rates despite the virtual elimination of their trade with Germany and Japan. An estimated 55% of this increase was due to higher prices. The physical volume of exports was about 46% higher. In contrast, the value of exports by the 17 other countries was approximately equal to the prewar average. Gains in the exports of Latin-American and other countries were offset by decreases for war-torn areas.

Although the "big three" also dominated import markets, the postwar expansion of their imports was much smaller—about 41%. Thus the index of the physical quantity of their imports was still somewhat below prewar levels. The destruction of productive capacity in the countries occupied during the war naturally retarded the recovery of imports from this group into the United States, the United Kingdom and Canada.

The gains in trade between the "big three" themselves were an important factor contributing to the postwar increase in their export-import trade. Most of this growth was in the exchange of goods between Canada and the United States. A second factor was the growth of their trade with Latin-American countries. During the first quarter of 1946, for example, exports to the American republics were three times their 1936-38 quarterly average; imports about two and one-fourth times. Germany was no longer a competitor. The restoration of trade with countries formerly occupied by the axis nations had its chief influence on the exports of the United States, the United Kingdom and Canada throughout the first six months of 1946. In the first quarter, exports of the "big three" to a group of 25 such countries located in Europe and the far east amounted to \$1,041,000,000 or about three times their prewar average. Of this total, the United States supplied \$774,000,000 as compared with \$148,000,000 before the war. Lend-lease and U.N.R.R.A. shipments from the 720 United States amounted to \$391,200,000; private relief shipments to \$19,500,000.

Several new names appeared in the postwar line-up of the world's ten top traders (Table XI). The United States took over first place in total trade from the United King-

dom. Imports of the United States rose to record levels and nearly matched those of the United Kingdom. As before the war, United States exports far exceeded those of Britain. Germany and Japan dropped out and Canada moved up to third place. On the export side, all liberated European countries were eliminated from the picture to be replaced by South American countries and British India. Brazil surpassed Argentina to take fourth place. Switzerland and Sweden also moved up on the list. On the import side, France led Canada to place third. Somewhat further behind were British India, Belgium, Switzerland and Sweden. To provide comparisons with prewar levels of trade and to facilitate approximate allowances for price increases, postwar values are shown as percentages of the prewar values in Table XII.

Britain's Program.—One of the outstanding developments of postwar trade was the achievement of the British in the reconstruction of their postwar exports. The efforts of the British government and industry to readjust Britain's foreign trade position to one more nearly in accord with that of a debtor nation were bearing fruit. During the war the United Kingdom concentrated on munitions production and cut exports drastically. Imports increased, especially of lend-lease munitions from the United States. But after V-E-day, exports of manufactured goods increased; imports of manufactures and munitions were curtailed, and raw materials increased. As a result the balance of merchandise trade improved rapidly.

A postwar export target of a 75% increase over prewar exports was established. Assistance in obtaining raw materials and labour were extended to the export industries. Allocations of domestic production between home and foreign markets were set up. After a series of alternate ups and downs during the last half of 1945, exports began to climb steadily until in July 1946 they reached \$388,400,

ooo, only 0.7% short of the goal. Since prices had risen by somewhat the same proportion, however, it was probable that the physical volume of trade was only slightly above prewar levels.

Imports also rose somewhat above the Oct. low established with the termination of lend-lease. The rise was partly because of the necessity for imports of raw materials and foods in order to get production in the export industries under way. The net excess of imports over exports continued a third lower than prewar values. For the first six months of 1946 it was \$650,000,000. With the ratification of the U.S.-British loan agreements (July 15, 1946) the foreign trade problems of the United Kingdom appeared well on the way to a solution.

Liberated Countries.—Although generally still well below prewar levels, the growth of exports from liberated countries in Europe and Asia was encouraging. Shipments from Norway and Denmark nearly equalled prewar values. In western Europe, exports of France and Belgium were more than 60% of prewar values during the first six months. Those of other countries were somewhat lower. However, it was the rate of increase rather than the level which was promising. In April, for example, total exports of six formerly occupied European countries were double their value in Dec. 1945 and four times their value eight months earlier in Aug. 1945.

Although direct data on total exports of liberated countries in eastern Europe and Asia were not available, data on the imports of the "big three" from these countries gave an indirect yardstick of their exports. Imports of the "big three" from both eastern Europe and liberated Asia were very nearly at a standstill in the third quarter of 1945—only \$8,000,000. During the first three months of 1946, they reached \$72,000,000—31% of the 1936—38 quarterly average value. The ratio for eastern Europe alone, however, was only 18%, whereas that for the far east was 37%.

For all these countries (except Czechoslovakia), imports far exceeded exports. In eastern Europe this was made possible by U.N.R.R.A. shipments, supplied chiefly by the United States. During the first quarter of 1946 the United States also supplied 86% of the shipments by the "big three" to liberated Asia. About one-fifth of these were U.N.R.R.A., lend-lease or private relief. Western European countries were not eligible for U.N.R.R.A. aid because they possessed some foreign exchange balances. Loans such as those from the U.S. Export-Import bank helped. Nevertheless, it seemed probable that the meagre foreign exchange balances these countries did possess at the end of the war were being rapidly depleted.

Recovery.-At the end of 1946, the over-all world trade picture appeared favourable. Trade between countries in the western hemisphere was at a new all-time high even with allowance for price increases. The United Kingdom was making a spectacular comeback. Exports of formerly occupied countries were small but growing rapidly. The types of products traded gave further proof of progress in the re-establishment of world trade. Foodstuffs were important, not only because of the famine situation, but also because of their normally important role in international trade. Shipments of raw materials such as cotton, wool and coal were also at high levels. Even in fields which faced difficult reconversion problems after the war, considerable recovery had been made. Many types of machinery and equipment were being shipped in larger quantities than before the war. New products such as penicillin, synthetic rubber and synthetic textiles had been added to the list of products entering into world trade.

There were a few question marks, of course. The future of Germany and Japan was one of them. The trend toward industrialization in many agricultural and raw material producing countries was another. Experience after World War I cautioned that surplus problems might arise in some foods when production on the European continent was restored. However, an over-all increase in productive capacity and trade potentials appeared a probable ultimate result of the war. The economic desirability of international specialization and trade continued undiminished. Mechanisms of trade which would permit the continuance and growth of the international flow of goods between diverse economic systems were in process of evolution. A favourable political environment for the growth of world trade remained to be achieved. (P. Ws.)

U.S. Trade Agreements.—During the late 1920s and early 1930s various types of trade controls aimed at restricting imports were drastically increased, and new ones were instituted by practically all nations. At the same time various governmental measures to enlarge exports, such as direct and hidden export subsidies, were adopted. Such programs disregarded the fact that in order to sell its products in world markets, a nation must also buy in those markets; that a nation must use the two-way street of international trade in both directions because, in the long run, exports can be paid for only in imports and services.

Passage of the U.S. Tariff act of 1930 raised tariff rates on U.S. imports to unprecedentedly high levels and thus contributed substantially to the building of higher and higher world trade barriers. Collapse of U.S. foreign trade soon followed; imports dropped 70% from \$4.400,000,000 in 1929 to \$1,300,000,000 in 1932, while exports dropped 69% from \$5,200,000,000 in 1929 to \$1,600,000,000 in 1932.

69% from \$5,200,000,000 in 1929 to \$1,600,000,000 in 1932. For the purpose of reviving U.S. foreign trade and expanding export outlets for U.S. farm and factory products and of raising the level of employment and standard of living, congress on June 12, 1934, passed the Trade Agreements act, authorizing the president to conclude trade agreements with foreign countries for reciprocal reduction and elimination of trade barriers. Thereafter the United States actively pursued a program looking toward the objectives of the act.

By the beginning of the 10-year period 1937–46 the United States had concluded reciprocal trade agreements with 15 countries. During the decade under review, agreements were signed with an additional 13 countries, or 28 in all. In the order of signature agreements were concluded with the following countries; Cuba, Brazil, Belgium, Luxembourg, Haiti, Sweden, Colombia, Canada, Honduras, the Netherlands, Switzerland, Nicaragua, Guatemala, France, Finland, Costa Rica, El Salvador, Czechoslovakia, Ecuador, United Kingdom, Turkey, Venezuela, Argentina, Peru, Uruguay, Mexico, Iran and Iceland.

The authority of the president under the original Trade Agreements act was conferred for a three-year term from June 12, 1934. Congress renewed that authority four times; for three-year periods in 1937 and 1940, for a two-year period in 1943 and for a three-year period in 1945. Under the act as passed in 1934 and as renewed in 1937, 1940 and 1943, the president had authority to modify rates of duty by 50% of the rates in effect when the act was originally passed. In the 1945 renewal and amendment of the act he was given authority to modify rates of duty by 50% of those in effect on Jan. 1, 1945.

Under the reciprocal trade agreements program important progress was made in reducing and eliminating barriers to international commerce. By 1946, the United States had obtained foreign concessions on U.S.

export products which accounted for 34% of total U.S. exports on the basis of 1937 export values, comprising 48% of total U.S. agricultural and 29% of nonagricultural exports.

In the agreements the United States had reduced 1,190 rates of import duties and had given assurances against increase of 62 existing rates. Duty-free entry of products under 120 tariff paragraphs was guaranteed against change. Under the traditional most-favoured-nation policy of the United States, rates fixed in an agreement with any country applied to the same or like products from any other country (except Cuba)² which had not been following trade policies or practices likely to defeat the purposes of the program.

U.S. exports to countries with which trade agreements were in effect during all or most of 1938-39 increased 63% compared to 1934-35, while exports to non-agreement countries increased only 32%.

During World War II practically all nations were compelled to regulate their trade so as to make maximum utilization of commodities and shipping facilities for the successful prosecution of the war. When the war ended, the United States took the leadership of the United Nations in a concerted action to reduce trade barriers and eliminate trade discriminations, to open world markets and to give equal access to the raw materials of the world to all peace-loving nations.

The United States invited all the United Nations to the conference which culminated in the Bretton Woods agreement, establishing the International Monetary Fund (q.v.) to stabilize international exchanges and prevent violent fluctuations in international currencies, and setting up the International Bank for Reconstruction and Development (q.v.) to assist nations in restoration work and start their wheels of production moving.

In Dec. 1945 the United States issued its Proposals for Expansion of World Trade and Employment. These Proposals were sent to other nations as a basis for discussion at a suggested international conference on world trade and employment. Such a conference was later called by the economic and social council of the United Nations.

Following the issuance of its *Proposals*, the United States invited 15 countries to participate in a preliminary meeting to negotiate reduction and elimination of trade barriers. The 15 countries were: Australia, Belgium, Brazil, Canada, China, Cuba, Czechoslovakia, France, India, Luxembourg, the Netherlands, New Zealand, the United Kingdom, the Union of Soviet Socialist Republics and the Union of South Africa.

These and like concerted international actions were designed to expand foreign trade, increase employment and enhance the economic level of all people, thus to increase the prosperity of the world, and to promote world peace and security. Interstate Commerce Commission

The Interstate Commerce commission, created by the Act to Regulate Commerce, Feb. 4, 1887, and the oldest of the United States regulatory commissions, observed its 50th anniversary on March 31, 1937. Its jurisdiction, originally confined to common carriers engaged in interstate commerce wholly by railroad or partly by railroad and partly by water, had been extended to other means of transportation, and its duties had been greatly increased by numerous amendments to the original act and by various supplementary enactments. The regulatory statute, known as the Interstate Commerce act, in its 1946 form consisted of four parts:

Part I. The jurisdiction of the commission under this part applying to:

- (a) Common carriers engaged in the transportation of passengers or property wholly by railroad, or partly by railroad and partly by water when both used under a common control, management, or arrangement, for a continuous carriage or shipment.
- (b) Common carriers engaged in the transportation of oil or other commodity, except water and except natural or artificial gas, by pipe line, or partly by pipe line and partly by railroad or by water.

(c) Express companies and sleeping car companies.

Part II. This part (added Aug. 9, 1935) as amended Sept. 18, 1940, provided for the regulation of the transportation of passengers or property by motor carriers in interstate commerce.

Part III. The provisions of this part (added Sept. 18, 1940) applied to the regulation of carriers by water engaged in interstate and foreign commerce.

Part IV. This part (added May 16, 1942) provided for the regulation of freight forwarders.

Important legislative enactments after Jan. 1, 1937, which affected the duties and functions of the Interstate Commerce commission were as follows:

The commission's jurisdiction over certain phases of transportation by air was transferred to the Civil Aeronautics authority by the Civil Aeronautics act, approved June 23, 1938.

The Transportation act of 1940, approved Sept. 18, 1940, which added Part III to the Interstate Commerce act, conferred extensive jurisdiction upon the commission over carriers by water. It also contained numerous amendments to existing law which affected the work of the commission and extended its regulatory powers to cover persons furnishing cars or protective service against heat or cold for property transported in interstate commerce.

The commission's power to deal with such emergency situations as shortages of equipment, congestion of traffic or other transportation emergencies were extended to cover similar situations with respect to motor carriers by the Second War Powers act of 1942.

Rates, Fares and Charges.—During the decade 1937-46 the Interstate Commerce commission made many decisions which affected freight rates, passenger fares and charges

of the carriers subject to its jurisdiction. The following were examples of important decisions which had broad general application:

General Commodity Rate Increases, 1937 (223 I.C.C. 657), decided Oct. 19, 1937. As a result of this decision, increases in rail rates on certain heavy basic commodities were allowed.

Fifteen Percent Case, 1937–1938 (226 I.C.C. 41), decided March 8, 1938. This provided for a general 10% increase in rail freight rates with certain exceptions. The commission found that the carriers' proposal for a general 15% increase had not been justified.

Increased Pullman Fares and Charges, 1937 (227 I.C.C 644). The commission authorized a 5% increase in Pullman fares and charges except that no increase was made in charges for upper berths in sleeping cars.

Eastern Passenger Fares in Coaches (227 I.C.C. 685). decided July 5, 1938, permitted railways in the east to raise coach fares from 2 to 2½ cents per mile for an experimental period of 18 months from July 26, 1938. Effective March 24, 1940, the maximum coach fare in the east was reduced to 2 cents per mile (237 I.C.C. 271).

Ex Parte 148—Increased Railway Rates, Fares and Charges, 1942 (248 I.C.C. 545), decided March 2, 1942. In its report in this case the commission found that the carriers' proposal for a general increase of 10% in freight rates had not been justified, but that with certain exceptions, the then existing rates might be increased by 6% and passenger fares and charges by 10%. Upon basic raw products except iron ore (no increase), coal and coke, the increase was limited to 3%. The increases allowed on coal and coke were specified amounts averaging somewhat less than 3%. Because of the relatively high earnings of the carriers as the result of war conditions, these increases, with certain exceptions, were suspended effective May 15, 1943 (255 I.C.C. 357) until Jan. 1, 1944 and were further suspended by subsequent orders of the commission. The 10% increase in passenger fares remained in effect, but the authority to increase commutation fares was revoked as of May 15, 1943.

On April 15, 1946, the railroads filed a petition with the commission for a general 25% increase in freight rates (with certain exceptions) to be made effective May 15, 1946. Common carriers by water and freight forwarders also filed petitions requesting similar increases in their rates and charges. The request was made because of falling revenues and increased costs of operation. After a hearing upon the request for an immediate increase, the commission on June 20, 1946, issued a decision in which it held that the carriers' request had not been shown to be just and reasonable as an emergency measure pending full hearings on all the proposals. Meantime the commission permitted the restoration of the emergency freight rate increases authorized on March 2, 1942, which had been under suspension, and made important additions and changes in amounts originally authorized. This resulted in an overall increase in rail freight rates of about 61/2% (Increased Railway Rates, Fares and Charges, 1942, and Increased Railway Rates, Fares and Charges, 1946). Hearings were scheduled to determine whether the carriers' proposals for larger increases were just and reasonable.

Increased Pullman Fares and Charges, 1942 (251 I.C.C. 172), decided March 9, 1942, provided for a 10% increase in Pullman fares and charges.

Class Rate Investigation, 1939 (262 I.C.C. 447). On May 15, 1945, I.C.C. issued a report and order as the result of comprehensive investigations covering class rates and freight classifications. The report contained three parts:

In Part I the commission found the railroad classifications of freight for the entire country to be unreasonable and unduly prejudicial as a whole to the extent that they were not uniform. The railroads subsequently agreed to submit for approval a uniform freight classification for the entire country. In Part II the commission prescribed a just and reasonable scale of class rates for application in connection with the uniform classification when established.

In Part III, as a temporary measure of relief from the violations of the act found in Parts I and II, the commission ordered that for an interim period until a uniform classification could be established, all class rates between southern, western trunk line and southwestern territories and between those territories on the one hand and official (eastern) territory on the other be reduced 10%. All class rates in official territory were required to be increased 10%. The commission said that this would greatly reduce the differences in the level of class rates in the various rate territories. The new rates had not become effective in 1946 because of temporary orders issued by the courts in suits instituted by certain affected parties.

Railroad Reorganization.—In the ten years 1937-46, the commission made considerable progress in completing the reorganization of railroads under the provisions of Section 77 of the Bankruptcy act. A number of large railroad companies emerged from trusteeship of the courts.

Research in Transportation.—During the decade the Interstate Commerce commission also expanded its research work and made important contributions in the field of transportation economics and statistics. The commission's Bureau of Transport Economics and Statistics rendered outstanding service during the war years in supplying government departments and various war agencies with factual data regarding transportation in the United States. In addition to regular periodic statistical reports, many special studies were released, a few of which were the following:

Railroad Sinking Funds and Funded Debt (1939)
Fluctuations in Railway Freight Traffic and Production,
1928-1941 (1942)

Freight Revenue and Value of Commodities transported on Class I Steam Railways (1943) Rail Freight Service Costs in the Various Rate Territories of

the U.S. (Published as Senate Document No. 63–1943)
A transportation cost-finding section was established in the above-mentioned bureau in 1937. This section made noteworthy progress in the development of cost of service formulas for railroads, water carriers and motor carriers and in the analysis of transportation costs for use in Interstate Commerce commission proceedings.

The Bureau of Valuation by 1946 had practically completed the valuation of pipe lines for rate-making purposes.

The commission's Bureau of Motor Carriers was organized in 1935 with appropriate sections paralleling similar sections or bureaus of the commission then in existence. Later, in the interests of administrative efficiency, several of the sections of the Motor Carrier bureau were merged with the older bureaus of the commission.

U.S. Transportation During World War II.—Upon the formal entry of the United States into World War II, President Roosevelt considered the time ripe for putting into effect a plan which had been under consideration for some time to co-ordinate the agencies and resources of the government and of the carriers with a view to meeting the wartime needs for transportation. He adopted a course which differed from that followed in World War I, during which the United States government took pos-

session and assumed control of the nation's railways. The Office of Defense Transportation was created by executive order "to collaborate with existing departments and agencies which perform functions and activities pertaining to transportation and to utilize their facilities and services to the maximum." Joseph B. Eastman, then chairman of the Interstate Commerce commission, was designated as director of the Office of Defense Transportation. He performed outstanding service in this capacity until his death on March 15, 1944. Col. J. Monroe Johnson, also a member of the Interstate Commerce commission, was chosen by the president to head the Office of Defense Transportation after Eastman's death.

In its 59th annual report to the congress the commission reviewed the remarkable performance of the nation's transportation agencies under the difficult conditions of war. With reference to the railroads it was stated that at the outbreak of war in Europe, and at times after Pearl Harbor, fears were held in some quarters that the railroads would not be able, with such aid as the government and shippers could give, to cope with the oncoming burden of war-weighted traffic. These fears were not wholly without foundation. The record showed, however, that substantially all military and essential civilian needs were met, though not without extreme effort and some tight conditions, a large measure of co-operative aid, and some inconvenience to essential civilian users.

Motor carriers, carriers by water, pipe lines, and domestic air lines also responded with a high degree of success to the varied and essential demands which the war placed upon them.

The commission's emergency powers with respect to movement of freight and passengers proved to be of utmost importance during the war period and its aftermath. Field agents of the Bureau of Service, located at strategic points throughout the country, worked in close co-operation with the Office of Defense Transportation on many transportation problems. Through the Bureaus of Safety, Locomotive Inspection and Motor Carriers the commission was actively engaged during the war years, as in peace time, in the important tasks of investigating accidents, inspecting carriers' equipment and enforcing statutes relating to safety in transportation.

Intestinal Disorders

See Alimentary System, Disorders of.

Intoxication, Alcoholic

During the decade 1937–46, greater and greater emphasis was placed on the issue of health and welfare in relation to the problems of alcoholism. In consequence there was accumulated a more exact body of knowledge concerning its nature, under what conditions it occurs, and what measures might be applied for its amelioration.

In general, the term "intoxication" is synonymous with

the word "drunk." The latter is a plain-spoken term, direct and inclusive, and indicates a state of being poisoned by alcohol. A drunkard, however, is one who habitually drinks to excess. He may be distinguished from heavy drinkers, not so much by the quantity consumed, but by the extent that his drinking becomes a personal and a social problem for him and a detriment to the common weal. It is the latter profound effect which alcohol has on a fairly large and often otherwise useful segment of the population that constitutes the main issue of the alcohol problem. In short, when drinking becomes a personal and social problem to an individual, affecting the common life, it constitutes a social disease with medicosociological implications.

The Role of Ethyl Alcohol.-It was early taught that some distilled spirits were more toxic than others and produced a more prolonged aftereffect. This gave rise to the speculative belief that substances other than ethyl alcohol were the principal toxic factors. From a later reexamination of this subject, it became evident that ethyl alcohol is the principal and main physiologically-active ingredient of all distilled liquors.

Experimental evidence indicated that alcohol is more rapidly absorbed for the first 30 minutes after ingestion and, contrary to a former belief, the rate of absorption was found to be uniformly more rapid in those habituated to its use. Moreover, studies on the metabolism of alcohol pointed to its clustering about the liver as the chief initial site for its oxidation. Liver function and carbohydrate metabolism, in which insulin plays a role, are all immediately connected with the subject of tissue tolerance to alcohol. Metabolism of alcohol, therefore, and not the absorption rate, appeared to be the principal factor in toler-

Effects of Acute Intoxication.—There is no question that acute intoxication is a proximal cause of acute gastritis. Obviously the more-commonly related observable effects of acute intoxication deal with such matters as reduction in personal efficiency, impairments in perception and judgment, and in co-ordination of motor functions. The earliest effects, however, are observable in the emotional sphere. The emotional modifications observed in the earlier stages of intoxication include a compelling realization of one's need for personal identification with others of a group. This experience, when shared by others, tends to lessen the so-called natural constraints among people. Such sharing serves not only to promote cohesion among the group, but it enhances one's individual feeling of selfregard and personal worth.

Further modifications are characterized by an increased feeling of well being and with it, an increased confidence in one's physical and mental prowess. With secure feelings of self-esteem, self-admiration and self-appreciation goes an increase of esteem, admiration, and appreciation for others. Despite objective evidence of a progressing impairment of judgment, seen in the more intoxicated individual, there is an ever increasing appreciation of one's own brilliant conversation, intelligence and personal worth, and with it an impulse of courage in which the need no longer exists for self-restraint or for inhibiting personal actions. The nature of these emotional effects of acute intoxication is of particular interest for some students of the alcohol problem. It is of special interest to those concerned with disturbances of brain metabolism and with the role which such effect may bear as a conditioning factor in habituation.

It is a trite but true observation that alcohol makes one feel different, and, if there is a need or a desire to feel differently about one's self or the world and its people, that need or desire may be fulfilled by alcohol. Studies conducted during the decade suggested that this aspect of intoxication might be an important factor in the psychogenesis of inebriety and of the mental disorders associated with it. It was increasingly appreciated that both physiological and emotional factors were important considerations for evaluating the nature of acute intoxication from alcohol and the relationship it bore to habitual drunk-

Legal Definition .- A report by the Committee for the Study of Problems of Motor Vehicle Accidents, published in the United States in 1941, served to crystallize the controversy heretofore revolving about the proposal of the National Safety council that persons are "drunk" when the concentration of alcohol in the blood reaches 150 m.g. or more per each 100 cc. Experimental evidence indicated that such concentration was too great a criterion for drunkenness for some persons, and too little for others. The committee, however, interpreted the results of chemical tests for alcohol concentration in the blood as follows: persons with a concentration of 0.15% or more are intoxicated; those with a concentration of 0.05% or less are not under the influence of alcohol; while those showing concentrations between 0.05% and 0.15% are likely to be influenced but are considered intoxicated only when a supplemental medical examination gives objective confirmation. The value of chemical tests for concentration of alcohol in the blood was more and more recognized as admissable evidence before courts of law in the U.S., with a growing trend of increased prestige for expert testimony in this field. The diagnostic criteria cited was incorporated in a proposed "uniform" law regulating traffic on highways issued in 1945 by the office of Public Roads administration of the U.S. govern-

Methyl Alcohol Poisoning.-Methyl or wood alcohol poisoning differs from ethyl alcohol intoxication in that the former is not fully oxidized in the body but is broken down into formic acid and formaldehyde. It results in a profound acidosis and appears to have a predilection for the retina as well as other nervous tissue. It may cause acute parenchymatous degeneration of the kidneys, liver, heart and other organs. Reports indicated that a milder course of poisoning might be manifest from wood alcohol, if ethyl alcohol was consumed immediately before or after drinking it. Progress was made toward successful treatment by overcoming the acidosis produced by it.

Salient Factors in "Alcoholic Diseases."-It had long been a more or less common observation that inebriates who consumed little food were most often the subject of so-called "alcoholic diseases." Those who are regularly and well and whose assimilation was undisturbed usually escaped these diseases. Moreover, pathologists had not supplied conclusive evidence that those diseases were produced primarily by alcohol.

After 1933 a more scientific approach toward a better understanding of the problems of alcoholism revealed that nutritional factors play a fundamental role in the production of physical and mental disturbances seen among drunkards. At first this matter was oversimplified by assuming that the substitution of vitamin-free alcohol for vitamin-containing food was the sole answer. Such an assumption ignored the factor of gastrointestinal disturbances with their accompanying dietary restrictions and changes in the absorption or utilization of vitamins; of the increased secretion of water soluble vitamins or imbalances in intake of various vitamin or other accessory food needs; and of the essential increased need of vitamins consequent upon an increased carbohydrate consumption represented by the calorie values in the alcohol consumed.

It became an established fact that the polyneuritis of alcoholics, pseudo alcoholic pellagra, Karsakoff's syndrome and certain types of encephalapathia alcoholic are definitely vitamin B complex deficiency diseases. The first two are specifically the result of a vitamin B₁ or thiamin deficiency. Moreover, "beer drinker's heart," characterized by myocardial insufficiency, closely parallels cardiac changes seen in beri-beri.

In 1941 Paul György and Harry Goldblatt published the results of experimentally producing dietary liver injury in rats, consisting of necrosis and cirrhosis. Later, other experimental studies were in complete agreement that an inadequate amount of casein in the diet is the determining factor causing hepatic injury consisting of fatty infiltration and degeneration, necrosis and cirrhosis. The effect of casein was explained on the basis of a lipotropic action and it was generally thought that this was in direct proportion to its content of methionine, which was found, experimentally, to prevent dietary hepatic injury when given in adequate amounts. The weight of evidence supported the view that cirrhosis of the liver is a multiple nutritional deficiency syndrome and that alcoholism is not its primary cause. Its prevention is concerned with an adequate caloric intake consisting of a high protein, low fat diet.

Studies also showed no correlation between the incidence and severity of gastritis and the duration and degree of alcohol consumption by inebriates. However, chronic alcoholism is often accompanied by impairment in gastric secretion, achlorhydria being commonly observed. Hypochromic iron deficiency and other forms of anaemia are often associated with the achlorhydria seen among chronic drunkards. These gastric disturbances and anaemia are correlated to inadequate amounts of casein in the diet. There was no standard body of observation to support the belief that alcohol plays any causative role in the production of arteriosclerosis or nephritis. Pancreatic disturbances are not uncommon in chronic alcoholism, and the inebriate seems more susceptible to infections. The role alcoholism plays in these two situations was still a moot point in 1946. There was, however, no evidence to support the view that the abrupt withholding of alcohol plays any role in precipitating an attack of delirium tremens. The latter was not clearly understood. It is characterized however, by an imbalance in cell permeability and water metabolism; by a dimunition of alkali reserve; a vitaminosis and a liver and pancreatic disfunction. In some instances these appear to be coupled with deeply seated psychogenetic factors.

Where and When of Inebriety.—Inebriety or chronic alcoholism is not infrequently observed as a complicating factor in schizophrenia, in epilepsy, and in the manic depressive psychoses and the psychoneuroses. Studies of the personality background of these caused some observers to regard alcohol addiction as a character reaction. In general, the personality traits reported appeared to revolve about the insecurity of the individual arising from multiple experiences in the evolution and development of his personality. Outstanding features included an early mother attachment and mother dominance; father rivalry and feelings of inferiority. Other characteristics reported include day dreaming, nocturnal and religious fears, disgusts of various kinds, overt or latent homosexual trends,

over-balanced heterosexual episodes, 'somatic complaints referable to the heart or stomach, and feelings of inade-quacy in meeting the social, educational and economic aspects of life. All these were reported to disappear under the influence of alcohol.

Obviously there are a great many people whose frustrations in life remain unresolved. Outwardly they appear unwilling to accept themselves, resent their limitations, want another chance, and seem unable to compromise their difficulties and to make the most of one's best or to live gallantly and courageously in a world peopled by others. Such persons may be fertile soil for the evolution of a conditioning process toward the repetition of intoxication which causes them to feel different about themselves and about other persons. The trend of opinion during the decade 1937–46 was, however, in the general direction that no one particular personality pattern characterizes the chronic alcoholic.

Unresolved frustrations and misevaluations of life's experiences may be a contributing factor for conditioning an individual to the habitual use of alcohol. Nevertheless, the immediate or precipitating causes of acute and chronic alcoholism cannot evade consideration of the causative role played by the availability or accessibility of beverages containing alcohol. Nor can it ignore the factor of tradition or customs of the people; nor the fashions of the time. Social sanction of drink is a subtle cause of alcoholism and drunkenness, as was illustrated by the relative increase of alcoholism among women whose drinking was more readily condoned and sanctioned than formerly.

Treatment.—Earlier experiences in the treatment of inebriates, or what was then known as "the reclaiming of drunkards," was characterized by many disheartening failures and disappointments. The decade 1937-46, however, fairly well crystallized a point of view for the selection of patients who could be expected to give greater promise for successful treatment. In general, this promise was greatest among those in whom alcoholism was unassociated with a physical or mental illness, with loss of memory, or moral values and judgment, and who were personally and sincerely convinced of their defeat by alcohol.

In general the decade did not witness any newly proposed specific treatment for inebriety. It embraced the correction of faulty nutritional situations and a psychological approach by one of several methods. The latter included the application of a contraconditioning measure through the substitution of either a conditioned reflex aversion for the taste or thought of alcohol, or other substitutes or contraconditionings having greater emotional values than alcohol, including transferences to activities such as religion or hobbies and changes of occupation or of the uses of leisure time. Other psychological approaches embraced the application of hypnotism with or without drugs or the evaluation of psychogenic factors involving difficulties of the whole person. The latter approach was highly individual in character, difficult, time-consuming, and hardly economically feasible for a large number of persons with the limited trained personnel available. Group therapy was endorsed by some, and successfully used; whereas social guidance, social support, and social encouragement exemplified by Alcoholics Anonymous had great value with some limitations.

The decade witnessed a revival of a former trend toward the state's assuming greater responsibility for providing public medical and institutional facilities for inebriates, notably in the U.S.S.R., Denmark, Norway,

Sweden, Finland, Switzerland and in the United States. The states of Massachusetts and Michigan proposed new legislation, and Illinois established a special treatment centre at one of its state hospitals. Connecticut enacted more specific legislation providing for a state-wide system for study, treatment and care of alcoholics. The program, financed by revenue from liquor licences, provided for establishing diagnostic and rehabilitation centres, for conducting out-patient clinics or dispensaries, and for a centre for the commitment and segregation of intractable or confirmed inebriates.

The decade also witnessed the development of several information, diagnostic and out-patient treatment centres by voluntary agencies in the U.S. and the organization of voluntary efforts for the dissemination of information on alcohol in relation to health and welfare. A significant development was the organization of the Research Council on Problems of Alcohol which had its inception in 1937 and became an associated society of the American Association for the Advancement of Science in 1938. Also significant was the organization of the Summer School of Alcohol Studies conducted by the Laboratory of Applied Physiology of Yale university, New Haven, Conn. in 1943, and the publication of the Quarterly Journal of Studies on Alcohol, the first number of which appeared in June 1940.

In the treatment and management of delirium tremens, spinal drainage and dehydration were no longer considered desirable. Instead, fluids should be forced, and sodium chloride administered to combat dehydration and restore normal acid base equilibrium. The diet should contain high caloric and vitamin values and mechanical restraint used sparingly. The use of morphine is dangerous; paraldehyde continued to be the sedative drug of choice.

One of the significant contributions to the treatment of severe acute intoxication concerned the simultaneous administration of insulin (15 units) and glucose. These, when combined, increase the oxidation of alcohol within the body. Experiments also indicated that doses of ethyl alcohol combined with hypnotics of the barbiturate group produce not only a prolongation of the hypnotic effect but also may produce deep anaesthesia, a characteristic not observed when administered independently. (See also Liquors, Alcoholic.)

Inverchapel, 1st Baron

Baron Inverchapel (Archibald John Clark Kerr) (1882), British statesman and diplomat, was born Mar. 17,
1882, a native of Lanarkshire, Scotland. Educated privately, he entered the diplomatic service in 1906 and served in a number of minor posts in various world capitals. During World War I, he enlisted in the celebrated Scots guards, 1918. He returned to the foreign service, receiving his first important appointment—that of British minister to Guatemala—in 1925. He also served as min-

ister to Chile, 1928-31, and Sweden, 1931-35.

His first ambassadorial post was in Iraq, 1935–37. In 1937, he was named ambassador to China. A friendly and "nonprofessional" diplomat, he enjoyed excellent relations with Chiang Kai-shek's government. Because of his diplomatic "flexibility," he was sent to Moscow in Feb. 1942 as ambassador to the U.S.S.R. At the time, British-Soviet relations, surfaced with diplomatic courtesy, were underlaid with deep and traditional distrust. The new ambassador, however, re-established more friendly relations and at one time was said to have ironed out a threatening snarl in relationships between Stalin and Churchill during one of the latter's wartime visits to the soviet capital. He attended the Tehran, Yalta and Potsdam conferences. It was announced Jan. 21, 1946, that Sir Archibald had been created 1st Baron Inverchapel of Loch Esk.

On Jan. 25, 1946, it was formally announced that the new peer had been made British ambassador to the U.S. Before assuming his new post, Lord Inverchapel went to Batavia, Java, on a special mission to mediate the Indonesian civil war. After returning to London to report on his mission, he embarked for the U.S. and presented his credentials to Pres. Truman on June 5, 1946.

Investment Banking

See BANKING.

Investments Abroad, U.S. and British

At the beginning of 1937, United States residents owned foreign securities and other property valued at \$11,000,000,000 (see table on page 727), about \$6,000,000,000 less than in 1930. Factors directly connected with the great depression were responsible for this decline. Operating losses served to reduce the book value of direct investments while the shortage of foreign—especially dollar—exchange stemming from a drastic lowering of world trade resulted in wide-spread defaults on dollar bonds. Prices of practically all foreign bonds fell sharply, and many of the securities were bought up by foreign countries at these reduced prices.¹

The figures in the foregoing paragraph do not include debts arising out of World War I owed to the U.S. government by foreign governments, including that of Germany. (See WAR DEBTS [WORLD WAR I].) It became clear by the middle '30s that little if anything would be collected further on these obligations, and it became customary no longer to include them in formal statements of U.S. investments abroad.

United States investments were concentrated in the western hemisphere, with Canada accounting for 28% of the total and Latin America for 37%. More than 50% of United States direct investments in Latin America were in extractive industries—agriculture, mining and petroleum—whereas in Canada more than 40% of the total was in manufacturing and related industries, such as paper and pulp. In Europe manufacturing and distribution accounted for well over half the total, while direct investments in the eastern hemisphere other than Europe were well distributed industrially.²

So-called portfolio investments—chiefly dollar bonds publicly sold in the United States in the '20s—were valued at \$3,500,000,000 (at market values) in 1936, of which about 35% were in default. Only a small portion of these securities—about 10%—were issues of private obligors; the re-

Direct investments are those in enterprises usually under the control of the investor—chiefly foreign branches and subsidiaries of domestic corporations. Portfolio investments consist of miscellaneous securities—such as dollar bonds—involving no management control on the part of the investor.

²U.S. Depart of Commerce, American Direct Investments in Foreign Countries, 1936 (1938)

mainder were obligations, direct and indirect, of foreign governmental entities.

The three years 1937–39, enclusive, saw little activity in the foreign-investment field. The market for new foreign bond issues in the United States had been almost non-existent after 1931, while the relatively depressed state of domestic economic activity precluded any large-scale foreign expansion on the part of U.S. industry. It is true that the value of direct investments rose slightly from \$6,700,000,000 at the end of 1936 to \$7,000,000,000 at the end of 1939. In some measure at least this resulted from the forced reinvestment of earnings; exchange restrictions in many countries prevented the transfer of these earnings to the United States in the form of dividends.

Substantial real and voluntary increases, however, took place in certain fields. Under the continued stimulus of preferential tariff arrangements and in keeping with the general industrial development of that country, the value of branch plants in Canada increased by more than \$100,000,000 between 1936 and 1940 (detailed data for 1939 were not available). The petroleum industry was especially active in developing new producing fields and enlarging refining capacity, particularly in Latin America (Colombia, Venezuela and Aruba, West Indies) and the middle east (Saudi Arabia and Bahrein Island). On the other hand, expropriation of the entire petroleum industry in Mexico by the government of that country wiped out U.S. investments valued at \$69,000,000 in 1936, although, as discussed below, some compensation was later received by the owners.

Various other factors had a substantial effect on the value of United States direct investments abroad during the prewar period, although the exact magnitudes could not be ascertained. Exchange depreciation took its toll, particularly in Europe and Latin America. Sales and liquidations amounted to \$87,000,000 during the 3-year period. On the other hand, reinvested earnings accounted for a \$344,000,000-increase in value.

Portfolio investments declined from \$3,500,000,000 at the end of 1936 to \$2,600,000,000 at the end of 1939. Most of this decline was because of continued redemptions and repatriations in excess of new issues; the par value of United States holdings of foreign dollar bonds fell from \$4,741,000,000 in 1936 to \$3,335,000,000 at the end of 1939. However, the average market price of United States-held foreign dollar bonds also declined during the period, from 74.7% of par value to 64.7%.

A few debtors who had defaulted on debt service during earlier years made adjustments with the bondholders during this period, among them Uruguay, Cuba, Chile and Poland. However, new defaults took place on Brazilian, Costa Rican, Yugoslavian, Austrian, Czechoslovakian and municipality of Panamá issues.

United States short-term investments abroad were also reduced during this period, and total investments—direct, portfolio and short-term—were valued at only \$10,200,000,000 at the end of 1939, compared with a maximum of about \$17,000,000,000 in 1930—31, and \$11,000,000,000 at the end of 1936.

The War in Europe, 1940-41.—With the outbreak of World War II in Europe, and especially following the German conquest of western Europe in the spring and summer of 1940, most U.S. corporations wrote off their books the value of subsidiaries and branches in German and German-occupied territories. Moreover, quite a number of them made efforts (sometimes successful) to dispose of their properties in Europe. International Telephone and Telegraph Corp., for instance, sold its Rumanian

operating subsidiary, and Eastman Kodak disposed of its 50% interest in Chemische Werke Odin of Germany. Other transactions were stopped by the U.S. treasury department, which by that time had frozen foreign funds in the United States and refused the necessary licences to transfer funds for this purpose, at least in some cases. Other U.S. companies were able to withdraw the liquid funds of their subsidiaries by transferring them to the United States in the form of advances to themselves. However, most U.S. property on the continent, except in neutral countries, remained to suffer from the active warfare which followed, although damage in 1940–41 was apparently relatively light.

Although certain bonds issued in the 1920s carried provisions calling for payment in time of war or peace regardless of the nationality of the holder, it was no surprise that axis countries or countries under axis domination did not service their dollar debt after the outbreak of war. Italy defaulted on all its dollar obligations on June 10, 1940, the date of that country's declaration of war on Great Britain and France. Japan, of course, also defaulted on the outbreak of war with the United States. Estonia and Czechoslovakia were forced to default after occupation by the U.S.S.R. and Germany, respectively. Bulgaria, Danzig, Germany, Greece, Hungary, Poland, Rumania and Yugoslavia also stopped all payments to the United States by the end of 1941, although none of these countries had previously been meeting full contractual service on their dollar obligations.

U.S. Investments Abroad, 1936, 1939 and 1946 (In billions of dollars)

Short-term investments	.8	.6	.6
Total investments	11.0	10.2	17.6

*Hess than \$50,000,000. Source: 1936 and 1939, Dept. of Commerce. 1946, estimated by author. Portfolio investments at market value, all others at book value.

The occupied countries of western Europe, on the other hand, managed to continue payment, except for the city of Antwerp, Belgium. Norway, Belgium and France—the two former operating through governments-in-exile—maintained full service while Denmark paid interest only, defaulting on sinking fund payments and on a \$30,000,000 maturity on Jan. 1, 1942.

By the end of 1940, the United Kingdom had practically exhausted its gold and dollar reserves, and it became evident that some other means would have to be found if that country were to continue purchases of war matériel and essential civilian supplies in the United States. Although the Lend-Lease act was passed in March 1941, the United Kingdom had already made commitments involving further large dollar outlays. As part of a series of measures designed to provide the necessary dollars, the Reconstruction Finance corporation in July of that year announced a loan of \$425,000,000 to Great Britain, secured, however, by a pledge of United States securities owned either by the British government or its nationals having an estimated value of more than \$500,000,000. Only \$390,-000,000 was actually disbursed, and since the income on the pledged securities was used to service the loan, the amount outstanding was reduced to about \$200,000,000 by the end of 1946.

In connection with the U.S. defense program, the Ex-

port-Import bank substantially extended its activities during this two-year period. Loans were made to Latin American countries to "assist generally in stabilizing their economies" and as "a part of the program to increase the delivery of strategic materials required in the United States." Primarily as a result of this Latin American program outstanding loans of the bank increased from \$65,200,000 at the end of 1939 to \$176,100,000 at the end of 1041.

Thus, even before its entry into the war, United States government credits to foreign countries became an important feature of the nation's international transactions, although the amounts involved were small relative to the huge lending program in which that government engaged

in 1946.

After U.S. Entry into World War II.-Although many U.S.-owned properties abroad suffered extensive physical damage during World War II, the actual net financial loss to U.S. investors could not be determined with any reasonable degree of accuracy. In most instances, probably, destruction was by no means complete, and the properties were or were scheduled to be returned to their United States owners. In some countries compensation was paid under war damage insurance or similar arrangements. Moreover, a special provision of the United States income tax laws permitted deduction of certain war losses in computing net taxable income, thus resulting in substantial tax savings for some companies. For the owners of direct investments as a group, moreover, losses in war areas were in a sense partly offset by larger-than-usual earnings on investments in the western hemisphere.

In spite of the many factors mitigating against such activity, some evidence of renewed interest in new direct investments abroad became apparent during the war. Mexico, for instance, reported a large number of new U.S. enterprises during the war years, many of them representing joint ventures of U.S. and Mexican capital. Large sums were spent on oil prospecting and development in Venezuela, Colombia and western Canada. Iron ore deposits were developed with U.S. capital in Canada and Venezuela; U.S. interests acquired control of the well-known Transportes Aereos Centroamericanos air line in Central America, and innumerable instances of the formation of new foreign subsidiaries of U.S. companies were reported in the press.

On the other hand some important liquidations occurred. International Telephone and Telegraph corporation sold its telephone-operating systems in Rumania (in 1941) and in Spain to the governments of those countries. About \$100,000,000 was involved in the two transactions. War-induced prosperity in the sugar industry led, paradoxically, to the repatriation by Cubans of a substantial number of U.S.-owned sugar properties in that island. Several of these had been owned by U.S. banks, who were forced to take them over to satisfy unpaid bank loans in the depression years of the early '30s.

In 1943 agreement was reached with the government of Mexico whereby about \$29,000,000 was to be paid for most of the petroleum properties expropriated in 1938, thus bringing to a close one of the most bitter disputes in the history of U.S. enterprise abroad.

The problem of expropriation was raised anew in 1945-46 as certain European countries—notably Poland and Czechoslovakia—undertook to nationalize their basic industries. Although compensation to foreign (Allied) investors

was promised, the details still remained to be worked out.

No new defaults on foreign dollar bonds were recorded during the war; on the contrary several long-standing defaults were permanently adjusted. Mexico, Brazil, Guatemala, the city of Montreal, Que., and the province of Alberta were included among the debtors announcing adjustments. In large measure the Latin-American settlements were made possible by the enhanced foreign exchange position of the countries concerned, in itself a direct result of wartime influences on their balances of international payments.

Transactions in Canadian securities were ot special interest. Stimulated partly by the hope of a capital profit when and if the Canadian dollar returned to par, U.S. citizens purchased about \$555,000,000 in Canadian securities during the period from 1942 to May 1946 by transactions in the open market. These purchases were partially offset by Canadian redemptions (net of new issues) of outstanding issues of about \$230,000,000 during the same period. It remained to be seen whether the appreciation of the Canadian dollar announced on July 5, 1946, would result in the return to the United States of the large volume of funds invested in Canada during the war years.

* * *

By far the most significant development of the war and the immediate postwar periods was the emergence of the United States government as the dominant factor in the investment of U.S. capital abroad, both at long and short term. Lend-lease and surplus property credits, Export-Import bank loans, special loans to the United Kingdom and the Philippines, and investments in and through the International Monetary fund (q.v.) and International Bank for Reconstruction and Development (q.v.) were the principal avenues for this tremendous capital outflow which by the end of 1946, it was estimated, totalled no less than \$5,700,000,000.

The movement got under way, as already mentioned, in 1941 with the Reconstruction Finance corporation loan to the United Kingdom. This was followed by substantial investments by government corporations in connection with the procurement of strategic and critical materials from abroad. The Defense Plant corporation, for instance, expended some \$44,000,000 for construction of productive facilities in Cuba, Peru, Chile and Ecuador, more than three-fourths of this amount being for a nickel plant in Cuba. Far more important, however, were advance payments made to foreign suppliers by the Metals Reserve company, Defense Supplies corporation, the U.S. Commercial company, the Commodity Credit corporation and similar agencies. By June 30, 1945, about \$639,000,000 had been thus advanced, although \$525,000,000 had been recovered, largely through delivery of the commodities involved. The investment involved in these advance payments was thus clearly of a short-term character, although in some instances (notably a \$70,000,000 advance payment to the Aluminum Company of Canada by the Metals Reserve company) the advances were for the specific purpose of enabling the foreign supplier to expand his permanent capital equipment.

Activities of the Export-Import bank from 1942 to the middle of 1945 were relatively small. Loans outstanding increased from \$176,100,000 on Dec. 31, 1941, to \$214,100,000 on June 30, 1945. Practically all these loans were made to western hemisphere countries and to China. With the end of the war in sight, however, it became apparent that the United States government would have to extend substantial credits to war-devastated countries in Europe and

³Annual Reports of the Export-Import Bank, 1940 and 1941.

the far east if they were to provide for the rehabilitation of their economies without a further tremendous burden on current consumption or even outright starvation. With this in view the administration sought and received an increase in the lending authority of the Export-Import bank from \$700,000,000 to \$3,500,000,000.

The abrupt end of the war with Japan and the resulting termination of lend-lease brought an immediate drain on this expanded lending power to finance the purchase of supplies which had been requisitioned under lend-lease procedures but for which contracts had not been placed as of V-J day, Sept. 2, 1945. It was important that the flow of supplies to the foreign countries not be interrupted. Such loans were granted in the amount of \$655,000,000 to France, Belgium and the Netherlands on terms equivalent to those extended, under the authority of the Lend-Lease act, for goods already in the "pipeline"—already on order or completed but not transferred—as of Sept. 2. These terms—interest at 23/8% with amortization over a 30-year period—were substantially more favourable to the debtors than the terms of other Export-Import bank loans.

These special credits formed more than 60% of total new loans authorized during the 6 months ended Dec. 31, 1945, which totalled \$1,040,000,000. However, because of the length of time which elapsed between the time orders were placed and goods were delivered, loan disbursements (including disbursements on previous commitments) during the same period were only \$58,600,000. At the end of Dec. 1945, \$1,600,000,000 of the bank's lending power was committed, of which \$300,000,000 was actually outstanding in the form of loans and \$1,300,000,000 represented undisbursed commitments. By June 30, 1946, however, outstanding loans had risen to \$700,000,000, with undisbursed commitments at \$2,000,000,000, leaving only \$800,000,000 unused. Practically all of this amount, moreover, was earmarked for specific loans, and the administration had indicated earlier in the year that it would seek an additional increase of \$1,250,000,000 in the lending power of the bank. (See also Export-Import Bank of Washington.)

Because of the peculiar position of the United Kingdom in the world economy and because of the tremendous deterioration in the international financial position of that country during World War II, special measures were taken by the U.S. government to remedy the situation. In particular, a loan of \$3,750,000,000 was granted, repayable over a 50-year period beginning in 1951, with no interest during the first 5 years and interest at only 2% after that. The loan was really a line of credit, available at any time up to Dec. 31, 1951, and was accompanied by certain commitments on the part of Great Britain regarding international financial and commercial policy to free world trade of some of the shackles with which it had been bound from 1931 and which were drawn much tighter during World War II.

The loan agreement provoked a tremendous public controversy in the United States (and Great Britain, for that matter) but finally passed both houses of congress by substantial margins and was signed by the president in July 1946.

Special legislation authorizing a loan of \$75,000,000 to the newly-born Philippine republic was enacted in the closing days of the 79th congress. Unlike other foreign loans, however, this would be for the purpose of meeting an internal budgetary deficit rather than for purchasing imports from the United States or elsewhere.

Agreements were also entered into with various countries which received lend-lease aid during the war, providing for the transfer on a long-term credit basis of lend-

lease goods in inventory or on order when the war ended. In some cases these loans were tied in with over-all settlements of war-period transactions, including all lend-lease and reverse lend-lease aid furnished. Great Britain, for instance, received a credit of \$650,000,000 for this purpose, \$472,000,000 of which was for the so-called lend-lease inventory, and the balance for surplus property, net claims and net lend-lease and reverse lend-lease transactions occurring after V-J day. The French agreement, signed in May 1946, provided for a credit of \$720,000,000, \$300,000,000 of which was for surplus property and the balance the net amount due the United States on all war transactions, including post V-J day lend-lease. Similar agreements were negotiated with other lend-lease countries; the commerce department estimated that credits totalling \$1,500,000,000 might ultimately be involved. (See also LEND-LEASE.)

The Foreign Liquidation commissioner was authorized to dispose of overseas surplus for cash, for credit, in settlement of claims against the United States government or for property or property rights, including intangible property or rights. It was estimated that credits extended for the sale of surplus property abroad might well reach \$1,000,000,000. The terms of credit varied from country to country but in no case were less favourable to the United States than the credit terms of the principal lend-lease agreements—23/8% interest and a 30-year amortization period. It was indicated also that some small amount of domestic surplus would probably be sold abroad on credit terms; the amount involved might be considered to be a part of the \$1,000,000,000,000 estimate just mentioned.

In addition, the maritime commission, under the Merchant Ship Sales act of 1946, was authorized to sell surplus vessels to foreign governments or nationals on long-term credit. No estimate of the amount of credit likely to be extended was officially forthcoming, although it might conceivably amount to several hundred million dollars. Terms permitted under the act called for a 25% cash down payment, amortization in not more than 20 years, with interest on the unpaid balance at 31/2%. (See also Surplus Property Disposal, U.S.)

Whether the value of civilian supplies furnished by the war department in liberated countries should be considered an investment remained a moot question. Although the war department maintained that the governments concerned would be billed for the supplies, it was doubtful whether any substantial amount would ever be recovered. The program amounted to much more than \$1,000,000,000 by the middle of 1946.

The International Monetary fund and the International Bank for Reconstruction and Development (qq.v.), both of which began operations in 1946, led to further vast investments of U.S. capital abroad. The United States government quotas in these two organizations, to the extent actually drawn on, would in effect constitute foreign investments. In addition the World bank could call upon the private capital market for funds, either by offering its own bonds or by guaranteeing bonds of foreign countries which might be offered in the United States market. The farreaching importance of these institutions could not be overemphasized. The fund attempted to provide a workable substitute for the old gold standard by combining maximum stability of international exchange rates with minimum interference with internal credit and employment policies. Attainment of the first objective would do much

⁴Dept. of State, Office of the Foreign Liquidation Commissioner, Report to Congress on Surplus Property Disposal—April 1946.

to encourage the international flow of capital from countries where it was plentiful to countries in need of outside capital for developmental purposes. The bank, of course, would more directly encourage such capital flows by spreading the risk among the various national governments of the world instead of placing it on the individual investor. (See also Foreign Investments in the United States.)

British Investments Abroad.—In the years immediately before World War II the increase in the amount of British investments abroad was checked as a result of the import surplus caused by rearmament. Moreover, an embargo was laid on the placing of foreign stocks and bonds in Great Britain. World War II brought about a sharp fall in the amount of British investments abroad. Before lend-lease began to operate the British government called in the U.S. securities held by British investors, in order to raise the dollars required for paying for vital imports. Apart from the dollar stocks and bonds employed as security for a loan from the Reconstruction Finance corporation, practically the entire British holding of U.S. securities was liquidated.

British investments in other countries were also practically liquidated or materially reduced. A number of dominion sterling loans were requisitioned and the proceeds were used for financing wartime imports from the dominions concerned. In addition, a number of overseas governments and private interests acquired large amounts of their British-held securities through purchases on the London stock exchange.

The German invasion of the continent and the Japanese invasion of southeast Asia caused further reductions in the amount of British investments abroad. Although the liberation of the continent restored to Great Britain its investments in western Europe, most of the money invested in central and eastern Europe was hopelessly frozen. Losses of investments in British and Dutch possessions and in China were much more substantial. Although British investors recovered their plantations, mines, factories, etc., after the end of World War II, the destruction wrought by war substantially reduced the value of these assets.

On the other side of the balance sheet there was the appreciation of many British investments abroad. The value of the dollar securities deposited with the Reconstruction Finance corporation increased materially as a result of the rise in Wall street shares. Rising prices resulted in an increase in the value of the remaining British holdings of South African gold-mining stocks and other empire investments. On the other hand, British investments in Latin America did not on the whole appear to have benefited by the prosperity brought to that continent

by wartime conditions, owing to the unwillingness of most governments concerned to allow foreign capital and enterprise to take a share in the benefit derived from that prosperity.

Before World War II British investment abroad was estimated at about £3,482,587,000. It was estimated to be considerably less than half of that figure in 1946. (P. Eg.)

Iodine

Production of iodine was not reported in the United States after 1937, when it amounted to 299,286 lb.; the output increased considerably during the years of World War II, but declined somewhat in 1944. The bulk of the world's supply continued to come from Chile, as a byproduct in the production of sodium nitrate. Since the possible recovery exceeded demand, production was irregular, as needed to maintain stocks. Imports were brought to the United States on the same basis, annual receipts varying from a low of 200,000 lb. in 1939 to a high of 2,744,930 lb. in 1943 and back to 220,526 lb. in 1945. Total imports during 1937–45 were 10,112,867 lb.

(G. A. Ro.)

See W. T Salter, Endocrine Function of Iodine (1940).

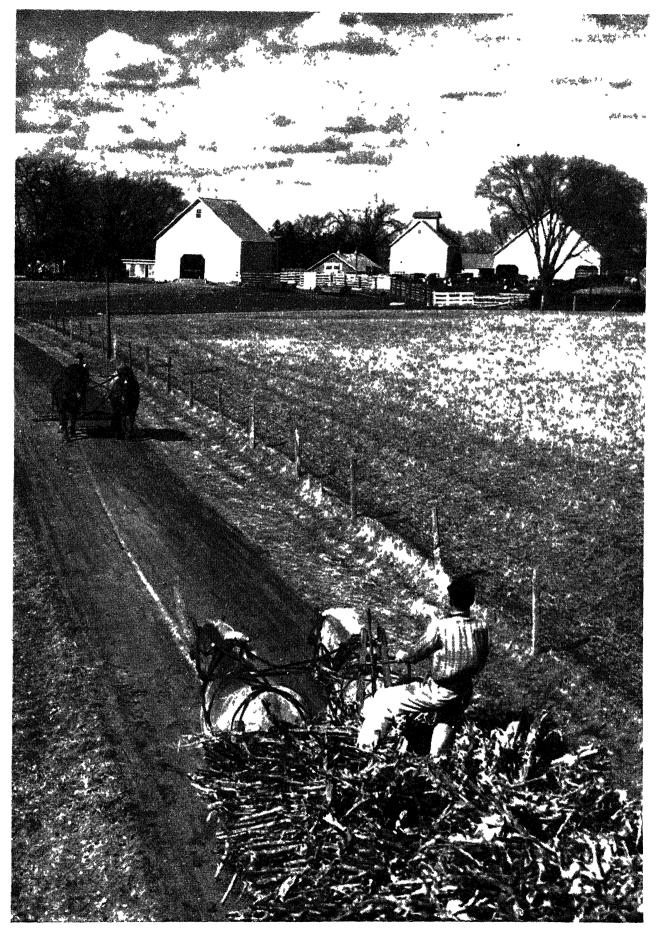

lowa

A north central state of the United States, Iowa was admitted as the 29th state on Dec. 28, 1846; popularly known as the "Hawkeye state." Area, 56,280 sq.mi., of which 294 sq.mi. are water. The pop. in 1940 was 2,538,268, with 1,084,231 listed as urban and 1,454,037 as rural. Of the total pop., 2,403,446 were native whites, 117,245 foreign-born whites, 16,694 Negroes and 883 belonged to other races. In 1944 the pop. was officially est. at 2,269,759. Capital, Des Moines (159,819). Other principal cities: Sioux City (82,364), Davenport (66,039), Cedar Rapids (62,120), Waterloo (51,743), Dubuque (43,892) and Council Bluffs (41,439).

State officers elected in Nov. 1936, who took office in Jan. 1937, were: governor, Nelson G. Kraschel; lieutenant governor, John K. Valentine; auditor, C. W. Storms; treasurer, Leo J. Wegman; secretary of state, Robert E. O'Brian; secretary of agriculture, Thomas L. Curran; attorney general, John H. Mitchell. A state conservation commission, a board of social welfare, a state commerce commission, a state planning board and an Iowa unemployment compensation commission were created or reorganized by the general assembly in 1937 (the planning board was abolished in 1939). The general assembly was in session from Jan. 11 to April 27, 1937. Among its important enactments was the complete revision of the motor vehicle code. The state highway patrol was increased from 50 to 103 men Provision was made for unemployment compensation, child welfare, old-age assistance, and the administration of social welfare. The tax laws were amended to provide a limited exemption for homesteads.

In the elections of Nov. 8, 1938, George A. Wilson (Rep.) was elected governor. Other state officers (all Rep.) elected were as follows: lieutenant governor, B. B. Hicken looper; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of state, Earl G. Miller; secretary of agriculture,

lowa farmland remained among the most productive in the U.S. during the years of World War II, and continued to yield the largest corn crop in the nation. Farmers are shown hauling corn stalks in Dallas county

Mark G. Thornburg; attorney general, Fred D. Everett; 732 superintendent of public instruction, Jessie M. Parker. In 1938 Iowa celebrated the centennial anniversary of the establishment of the territory of Iowa. (B. F. S.; X.)

Gov. Wilson was re-elected in the elections of Nov. 5, 1940. Other officers elected (all Rep.) were the following: lieutenant governor, B. B. Hickenlooper; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of state, Earl G. Miller, secretary of agriculture, Mark G. Thornburg; attorney general, John M. Rankin; superintendent of public instruction, Jessie M. Parker. In the presidential election Willkie received 632,370 votes and Roosevelt, 578,800.

State officers (all Rep.) elected Nov. 3, 1942, to take office on Jan. 1, 1943, were: governor, B. B. Hickenlooper; lieutenant governor, Robert D. Blue; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of state, Wayne M. Ropes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin; superintendent of public instruction, Jessie M. Parker.

The general assembly was in session from Jan. 11 to April 8, 1943. Among the acts passed was one providing "rules of civil procedure." John M. Grimes was appointed treasurer on Oct. 21, 1943, to fill the vacancy caused by the death of W. G. C. Bagley.

In the elections of Nov. 7, 1944, principal state officers elected were: governor, Robert D. Blue; lieutenant governor, K. A. Evans; secretary of state, Wayne M. Ropes; auditor, Chet B. Akers; treasurer, J. M. Grimes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin. B. B. Hickenlooper was elected U.S. senator to succeed Guy M. Gillette. Jessie M. Parker was elected superintendent of public instruction in 1942 for a fouryear term. All elected state officers and all Iowa senators and representatives in congress were Republicans. The popular vote for the Republican presidential electors was 547,823 and for the Democratic, 497,376. (R. A. Ga.)

The 51st general assembly, consisting of 50 senators and 108 representatives, met in regular session from Jan. 8 to April 12, 1945. One of the principal laws enacted was a compulsory retirement and annuity plan for all state and local government employees. Inadequate support and political control of state penal and charitable institutions

finally culminated in the death of an inmate of the Training School for Boys at Eldora, from the infliction of corporal punishment; a series of concerted escapes followed. A general investigation of conditions was begun.

Principal state officers elected in Nov. 1946 to take office in Jan. 1947, were as follows (all Republicans): governor, Robert D. Blue; lieutenant governor, Kenneth A. Evans; secretary of state, Rollo H. Bergeson; auditor, Chet B. Akers; treasurer, J. M. Grimes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin; and superintendent of public instruction, Jessie M. Parker.

BIBLIOGRAPHY -C. Cole, Iowa Through the Years (1940); Federal Writers' Project, Iowa: A Guide to the Hawkeye State (1938); Iowa Official Register (bienn.).

Iran, an independent constitutional monarchy, is bordered by the soviet union to the north, Turkey and Iraq to the west, the Persian gulf and the Indian ocean to the south and Baluchistan and Afghanistan to the east. Its area in 1946 was 628,000 sq.mi.

The official estimate of the population in 1934-35 was 15,055,000. British military estimates were 30% lower. The Middle East Supply Center based distribution of goods on a population of 12,500,000 (1942–45). There had never been a complete census.

The urban population in the 40 largest towns numbered 2,500,000. Rural population was estimated at 7,500,000 to 8,000,000 while tribal nomads in mountainous regions numbered about 3,000,000 people. The population is composed of three main racial stocks. The Iranian (Persian, Gilak, Kurd, Lur and related groups) comprise 60% (about 8,000,000-9,000,000) of the population. The Turanian (Turki, Qashqai, Turkoman groups) comprise 35% (about 4,500,000-5,000,000) of the population. The remainder are of Semitic (Arab, Jewish or Assyrian) stock with a small sprinkling of Negroid elements in the south along the Gulf coast.

Tehran, the capital city, had a population of 540,087 according to the census taken in 1940-41, but war condi-

tions swelled this number to nearly 800,000 in the "bread census" taken in 1943. Other important cities, with their 1940-41

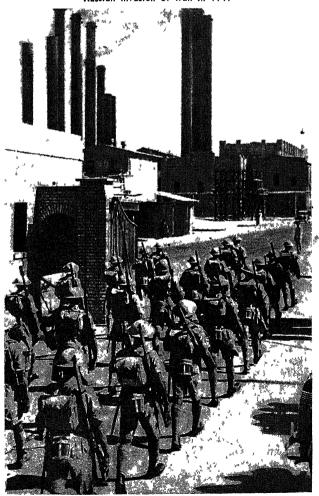

populations: Tabriz (213,542); Isfahan (204,598); Meshed (176,471); Shiraz (129,023); Resht (121,625); Hamadan (103,874); Kermanshah (88,622).

Persian is the official language, but north of 36° Turkish predominates on the plateau while a Persian dialect known as Gilak is spoken in the subtropical Caspian sea provinces. Kurdish is spoken along the western border, and various tribal dialects of Persian or Turkish known as Luri, Qashqai and Baluchi are spoken in the mountains along the southern borders. Arabic is a common tongue in Khuzistan (S.W. Iran). Armenians speak their own tongue while the Assyrians speak Syriac.

The state religion, established in A.D. 1499, is the sect of Islam known as the Shiah, recognizing 12 Imams. The 500,000 Kurds are Sunni. There are groups of subsects known as the Ali-illahi and also followers of the 19th century movements called Babis and their successors the Bahais. Christians belong to the Armenian Gregorian (50,000), the Nestorian (20,000), the Greek Catholic, the Uniate Catholic and the Protestant churches. About 15,000 Zoroastrians have their centre in Yezd. Jews (25,000–30,000) are concentrated in the cities of Tehran, Hamadan, Isfahan and Kermanshah.

Prime ministers during the decade were as follows: Mahmud Jam (Dec. 5, 1935–Oct. 26, 1939); Dr. A. Matin Daftari (Oct. 27, 1939–June 25, 1940); Ali Mansur (June

Riflemen of the Indian army entering the huge petroleum refinery on the island of Aradian, in the Persian gulf, during the Anglo-Russian invasion of Iran in 1941

25, 1940-Aug. 27, 1941); Mohammed Ali Feroughi (Aug. 27, 1941-March 2, 1942); Ali Suhaili (March 9, 1942-July 28, 1942); Ahmad Ghavam-es-Saltaneh (Aug. 1, 1942-Feb. 13, 1943); Ali Suhaili (Feb. 17, 1943-March 26, 1944); Mohammed Said Maraghei (March 28, 1944-Nov. 9, 1944); Murteza Quli Khan Bayatt (Nov. 21, 1944-April 17, 1945); Ebrahim Hakimi (May 11, 1945-June 3, 1945); Muhsin Sadr (June 8, 1945-Oct. 2, 1945); Ebrahim Hakimi (Oct. 24, 1945-Jan. 20, 1946); Ahmad Ghavam-es-Saltaneh (after Jan. 26, 1946).

Pahlavi's Iron Rule.—The last four years of Riza Shah Pahlavi's rule (1937–41) marked a period of tyranny. Riza Shah had developed tremendous energy which expressed itself in a mania for acquiring personal wealth as well as in attempting to make Iran a self-sufficient state. He was the nation's first consul, first merchant and first land-owner. Opposition was purged by legal or illegal means. Fearing revenge or assassination, the shah took elaborate precautions to isolate himself from the public. Utilizing his fear, unscrupulous hirelings blackmailed guilty and innocent alike. Prominent people lived in the grip of a mounting terror.

Centralization and control of the economic life of the country was effected by organizing about 27 government monopolies. These squeezed out any foreigners except the Germans, who entered into a large scale barter agreement after Hjalmar Schacht had visited Iran in the spring of 1937. Germany absorbed the largest share of Iran's agricultural exports and supplied machinery which needed German technicians to install and operate. While relations with Germany were improving, relationships with the United States, France and Great Britain were exacerbated by small and unimportant incidents which the shah, in his megalomania, took as personal insults. In 1938 relationships with the soviet union were irritated when the U.S.S.R. expelled 40,000-50,000 ragged and destitute people who, the Russians claimed, were Iranian citizens and had never applied for soviet citizenship. Among this horde the police detected several individuals whom they suspected of being soviet agents. There followed a spy purge in which some suspects were shot, some imprisoned and some disappeared. A few of the latter groups later became internationally famous. There was much talk of approaching war when Italy invaded Ethiopia, wherefore Afghanistan, Iran, Iraq and Turkey buried their minor differences and met at Saadabad, outside Tehran, and in July 1937 signed a nonaggression and friendship pact, intended to lessen danger of foreign intrigue and invasion. Xenophobia was also responsible for the order issued in Sept. 1938, prohibiting Iranian citizens from enrolling in any foreign schools. Meanwhile the newspapers carried glowing reports of industrial progress-highly exaggerated-describing new textile mills, sugar refineries, soap and oil factories, a copper refinery, mammoth government buildings, mostly in or around the city of Tehran. The shah ordered elaborate ceremonials to dramatize the "era of progress." On Aug. 27, 1938, special trains carried all important officials to Sapid Cheshma (later renamed Fawzieh) to watch the driving in of a golden spike linking the tracks of the Trans-Iranian state railway. This 865-mi. road, costing \$154,708,133 raised mostly by tea and sugar revenues, had been under construction for almost 11 years and had surmounted engineering difficulties of the greatest magnitude. Yet the shah at once ordered extension of the rails to link other provincial capitals with Tehran. In March 1939 the Crown Prince Mohammed Riza, who had spent several

years in a Swiss school before returning to Iran in 1937, married Princess Fawzieh of the Egyptian royal family, with ceremonials surpassing anything Tehran had ever seen before.

At the same time there were strong undercurrents indicating that the top-heavy structure being built by the shah was approaching a collapse. Granting of an oil concession to the Am-Iranian Oil company (Seaboard Oil) had raised hopes of larger revenues and profitable employment. But in 1938 the company allowed the concession to lapse, stating that it did not feel the concession could be profitably operated at that time. The national budget was skyrocketing, having multiplied ten times in ten years from \$15,-000,000 in 1928 to \$150,000,000 in 1938. Forced settlement of the wandering tribes, diversion of the provincial wealth to concentrate on Tehran, and reliable reports of large scale corruption all combined to breed a spirit of revolt in the provinces. Tehran had grown from a city of 300,000 in 1925 to a city of 500,000 in 1939, while other cities and towns remained relatively stagnant by comparison.

When war came in Sept. 1939, Iran remained neutral, but economically the situation deteriorated rapidly. Iran had large credits because of heavy grain shipments to Germany, but imports practically ceased. Restriction of foreign goods and inadequate local production had combined to exhaust reserves of consumer goods. In 1941 harbingers of war multiplied when a group of Iraqi rebels accompanied by the grand mufti of Jerusalem fled from Baghdad on May 29 and entered Iran. In July the soviet union and Great Britain demanded that Iran expel the German colony, estimated at 1,500. Riza Shah promised to reduce their number gradually.

Allied Occupation.—Three major factors, however, impelled the Anglo-Russian allies to act at once. First was the danger of an axis fifth column in Iran. Second was the use of the Iranian transport system for supplies to the soviet union and third was the need for guaranteeing uninterrupted operation of Iranian oil resources. On Aug. 25 soviet armed forces poured in from the north while British empire forces attacked from the southwest. The Iranian army was totally inadequate to meet the situation and, after four days, resistance ceased.

The blow to Iranian morale was complete. The public was stunned while the shah was bewildered. Foreign radio broadcasts in Persian described how their ruler had terrorized them, embezzled funds, illegally confiscated land and possibly even stolen some of the crown jewels. On Sept. 16, the crushed monarch abdicated while foreign troops entered Tehran. His son, Mohammed Riza, then 23 years of age, mounted the throne. The 70-year-old exshah sought exile first in Mauritius and then in Johannesburg, South Africa, where he died in 1944. As his car took him south to board a British cruiser, the prison doors opened, freeing tens of thousands of political prisoners who held no love for the name of Pahlavi.

The public at first expressed some sense of freedom, but the accumulative evils of war, added to the inefficiency and corruption in public life, gripped the whole of Iran. Rains had been subnormal, and cereal supplies were low. The foreign armies began to purchase many supplies on the open market. More than 200,000 ragged and half-starved Poles entered Iran, bringing typhus with them. All transport was absorbed into the "Aid to Russia" plan under the authority of the United Kingdom Commercial corporation. Prime Minister Mohammed Ali Feroughi, aged, sincere and patriotic, found his government harassed

by emergency financial agreements, provincial tribal revolts, parliamentary anarchy and an undisciplined press castigating any authority. Economic chaos was intensified by unscrupulous hoarding; the Allies made military demands which Iran was reluctant to grant. Nevertheless on Jan. 29, 1942, Feroughi was able to get parliament to approve the Anglo-Soviet-Iranian treaty by which Iran granted all facilities to the Allies for prosecution of World War II, in return for which the Allies guaranteed to defend Iran, to respect its sovereignty and territorial integrity and to withdraw their armed forces within six months after the ending of hostilities. The tide of crises was rising while Feroughi's own strength was on the wane. On March 2, 1942, he resigned and left Tehran muttering, "The burden is too great." Shortly thereafter he died.

The task of the government was to find some equilibrium in the turmoil caused by the strains of war. The soviet. union demanded credits for purchases of supplies, both to feed its army in Iran and to import goods needed for the prosecution of the war. On May 2, 1942, a soviet-Iranian financial agreement was signed which was to result in Iran's giving a credit of \$35,000,000 for supplies and services to the soviet union, of which 60% was to be paid for in gold within six months of the termination of hostilities and the remaining 40% would be returnable in goods. The soviet drove another hard bargain in demanding full output of army light combat equipment under threat of heavy penalties. The British rushed improvement of trunk roads and began construction of a system of defense for the oil fields. Advance units of the U.S. army appeared in the summer of 1942, anticipating the 30,000 service troops of the Persian gulf command that followed six months later. To meet these unprecedented situations, the government decided to request a number of advisory missions from the United States. Within six months there were U.S. advisers to the army, the gendermerie, the police, the ministry of finance, the department of agriculture and public health, also a short-lived adviser to a special ministry of foods which was established in Sept. 1942.

The problem of food became paramount in the late fall of 1942. The soviet union purchased 40,000 tons of wheat and 30,000 tons of rice which exhausted known stocks in the country. To avoid famine conditions, Great Britain and the U.S. sold and shipped to Iran a total of 90,000 tons of cereals. The bakers in Tehran seized the opportunity to adulterate rationed flour with cheap ingredients, including straw, and then diverted part of their supply to the black market. Public patience came to an end in bread riots on Dec. 8, when some members of parliament were roughly treated and some British soldiers were killed in Parliament square. Prime Minister Ghavam suffered a plundering of his home during the disturbances.

During 1943 the crisis began to abate. The soviet union returned 25,000 tons of wheat in May. There were superabundant rains. Addition of large numbers of locomotives and cars to the railways in addition to lend-lease supplies eased the transportation situation. On Sept. 9 Iran declared war on the axis powers. The same month the underground chief of the German fifth column, Franz Mayr, most of three parachute crews and some 200 members of Mayr's subversive group were rounded up and placed in custody. Later the remainder of the German agents were surrendered in the south. The German scheme to promote rebellion and sabotage had failed completely. The crowning event of the year was the Tehran conference of Generalissimo Joseph Stalin, President Franklin D. Roosevelt and Prime Minister Winston Churchill. A special communique of Dec. 1 recognized the assistance Iran

had given in World War II and noted the special economic difficulties which had grown out of world-wide military demands. They promised full consideration of postwar problems and recorded their desire for the "maintenance of the independence, sovereignty and territorial integrity of Iran."

(See also International Conferences, Allied [World War II].)

The summer of 1944 established two records. Supplies were flowing across Iran to the U.S.S.R. at the rate of 275,775 metric tons per month. Inflation also touched a new high. The cost of living index, compared with that of 1936-37, showed an average of almost 1,000% rise. Lodging had reached 1,500% while food and clothing were nearly 900%. The American Financial mission, although given extraordinary legal powers, faced some insurmountable factors, but it also found itself vociferously attacked by vested interests and speculators who were making large profits at public cost. Efforts to operate in the soviet dominated zone were completely frustrated. Signs of internal dissension were on the increase. A political party known as the Tudeh (masses) had been organized in 1942, its leaders coming from three main groups. The first included some of the earlier socialistic liberals of 1930-41 whom Riza Shah had imprisoned. To these had been added a group of those who had come in from the soviet union in 1937-39, while a third component was made up of former Iranians and Caucasians who had entered in the wake of the soviet armed forces. The party was strong only where there were soviet troops. In the opposing camp was a group of conservatives rallying about the person of Saiyid Zia ud-Din Tabatabai, stormy petrel of earlier days, who had been prime minister in 1919, then fled the wrath of Riza Khan the same year. Widely accused of being a British agent, he returned from Palestine in late 1943, organized several political groups and vigorously attacked the Tudeh and the soviet union's interference in Iranian internal affairs. The two groups came into open and violent collision in Sept. 1944 over the touchy question of oil concessions.

Trouble with the U.S.S.R.-In Sept. 1944, two U.S. oil representatives and one from Dutch Shell Oil opened negotiations for concessions in southeast Iran. Shortly following them, a large soviet delegation arrived, headed by Sergei Kavtaradze, undersecretary for foreign affairs of the U.S.S.R. The proposals of the three aforementioned companies were clearly defined, but Premier Said was unable to get a definitive statement from the soviet union other than that their concession would include all mineral and subsoil rights, communications, trade schools and other associated prerogatives in an area of 216,000 sq.mi. then held by soviet troops. Iran's dealings with the soviet union connected with the financial agreement of 1942, the munitions contract of the same year and the Caspian sea fisheries all showed heavy deficits, though the latter should have produced substantial profits. The Iranian government, made up from the small class of landowners, was hesitant to do business with a totalitarian state professing the communistic creed. Wherefore on Oct. 16, the prime minister announced his cabinet's decision to defer all oil negotiations while foreign troops were on the soil of Iran. On Oct. 17, Tass reported the refusal following which the soviet press and radio sharply attacked the Iranian government, calling it unfriendly and accusing it of fomenting sabotage. Throughout the soviet-occupied zone of Iran, the Tudeh party, often accompanied by trucks bearing soviet armed troops, organized demonstrations, demanding

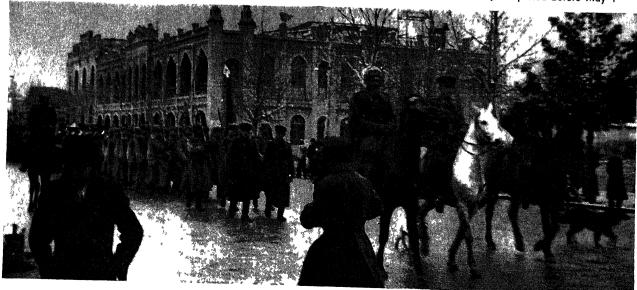

the fall of the government and the granting of the oil concessions to the U.S.S.R. The soviet ambassador refused to meet the prime minister. Violence occurred and in several incidents, soviet troops disarmed and imprisoned central government security forces. Shipments of food from the north were halted. Unable to weather the storm, Premier Said resigned on Nov. 9. For the next 14 months Iranian cabinets fell with monotonous regularity while the soviet union failed to reply to practically all of the communications addressed to it by Iran. To ease the pressure upon the cabinet, parliament voted on Dec. 3 to forbid ministers from conducting negotiations of a legal character regarding oil. Kavtaradze publicly announced his disapproval of the law and departed, but from that day the Tudeh party seized authority in the soviet occupied areas, set up armed police posts on the roads, and completely paralyzed the functioning of the Tehran govern-

In May 1945, after V-E day, the Iranian government requested foreign troops to withdraw. The United States replied that it was already so doing. The British stated they were sympathetic but would have to consult with their allies. The soviet union did not reply. National elections were scheduled during the fall, but parliament, noting the iron vise by which the Tudeh was ruling the northern provinces, voted to delay elections till all foreign troops had withdrawn. Victory over Japan produced an electric effect in the Tudeh party. In Aug. 1945 party chiefs and prominent Kurds were taken to Baku in soviet territory and there instructed by Pres. Muhammad Baghiroff of the Azerbaijan socialistic soviet republic how to form a new "democratic party." On Sept. 2, Tudeh leaders in Tabriz issued a manifesto of the new "democratic party" and on Sept. 17 the same men assembled and dissolved the provincial Tudeh party. The soviet ambassador refused a request of the Iranian government to send extra gendermerie units to Iranian Azerbaijan, whereupon the Iranians on Sept. 12 sent a second note requesting all foreign troops to withdraw. A week later Great Britain suggested a partial troop withdrawal, to which Soviet Foreign Minister Vyacheslav Molotov replied that soviet withdrawal was governed by the Tripartite treaty of 1942 and no discussion on the matter was called for. The Tudeh party, now called Democratic, emerged in Azerbaijan province with its own private army, the arms largely being those captured by the soviet forces from the central government in Aug. 1941. When Iran attempted to assert its right to send reinforcements to the security forces in the northwest, soviet tanks stopped them near Kazvin on Nov. 18. Isolated, threatened and in some cases attacked, with small units wiped out, the beleaguered government forces in Azerbaijan surrendered by Dec. 12, when the Democratic party decreed the establishment of an autonomous state and the soviet consul graced the first meeting of the People's congress in Tabriz. Shortly thereafter, when reinforcements of soviet combat troops manoeuvred in their vicinity, the Kurds issued a manifesto of autonomy.

On Nov. 24, the United States suggested that all foreign troops evacuate Iran by Jan. 1, 1946, which it proceeded to implement at once. The soviet government refused and Great Britain followed suit. After other unsuccessful attempts, on Jan. 19, 1946, Iran complained against soviet interference to the United Nations Security council meeting in London. To this accusation Andrei Vishinsky replied, "It is true," but he insisted that the two countries could solve their difficulties by bilateral negotiations. When the date set by the treaty for soviet evacuation arrived-March 2, 1946-the soviet announced that they would remain indefinitely in certain areas of Iran. The new prime minister, Ahmad Ghavam, was in Moscow, yet on March 3, claiming that soviet demands exceeded his constitutional authority, he protested the refusal of the soviet union to abide by its treaty obligations. The same day Great Britain protested the breach of the Treaty of 1942, and on March 6 the United States addressed a note urging the soviet union to adhere to its pledges. The latter two notes were not answered by the U.S.S.R. Iran then complained a second time to the Security council on March 19. At the sessions the soviet representative, Andrei Gromyko, at first denied the right of Iran to complain, then he sought a postponement; later he threatened to boycott sessions if the council should consult the Iranian representative. On April 4 he announced that the soviet would withdraw by May 9 unconditionally after Ghavam had agreed to the

First Russian troops to leave Iran, shown moving through Meshed in eastern Iran on April 2, 1946. Evacuation, which was to have taken place by March 2, according to the Anglo-Soviet-Iranian treaty of 1942, was not actually completed before May 4

formation of a joint Soviet-Iranian Oil company. The soviet representative stayed away from Security council sessions whenever the Iranian complaint was scheduled to appear on the agenda. The oil proposal had to await the approval of parliament, which had come to an end on March 11, 1946. Election of the 15th parliament awaited soviet evacuation of Iran, which was unofficially reported late in May although rumours persisted that many agents remained behind in Azerbaijan uniforms. After May 9 the Azerbaijan leaders indicated a less belligerent attitude toward the central government, and with the soviet ambassador often sitting in on the negotiations, an agreement was finally announced on June 13 by which Azerbaijan would retain most of its autonomy.

With an apparent solution of Russian-Iranian relationships in sight, the prime minister turned his attention to internal reforms. A general reorganization of Iranian economy was forecast in the appointment of a supreme economic council, a supreme labour council and in the promulgation of orders proposing distribution of public domains to the peasants, reforms in landowner tenant relationships and in public services. A number of conservative newspapers were suppressed; Saivid Zia ud-Din Tabatabai and other conservatives were arrested, and stern warnings were issued against obstructionism. There was a general exodus of wealthy landowners who had been identified with what the soviet had denounced as reactionaries while Tudeh leaders began to appear in places of authority. For the moment, at least, Iran, under the steering of Ahmad Ghavam, was sailing in a new direction.

What this direction was became alarmingly clear within a month. The Tudeh party, now protected by soviet representation in Tehran and possessing a "people's" army in Azerbaijan, struck swiftly southward to capture and consolidate the oil-rich gulf regions as rapidly as possible. A general strike of Tudeh-affiliated trade unions was called in the Anglo-Iranian oil refinery at Abadan on July 14, 1946, which resulted in three days of bloody fighting and the establishment of martial law. But this bold move aroused violent reactions on the part of anti-communist groups, especially the Qashgayi tribes, who demanded a purge of pro-soviet elements. They revolted in Oct. to enforce their demands. At the same time it became painfully apparent in Tehran that cabinet members were reporting directly to the soviet ambassador. This brought on a national crisis on Oct. 16 resulting in the dropping of five Tudeh and pro-soviet members from the government. Aroused by these events, Iran decided to have a final showdown on the Azerbaijan issue. On Dec. 9, Ghavam ordered armed forces to enter Azerbaijan and reestablish central government authority. The local population not only refused to fight for their soviet-imposed rulers but turned upon them. By the 11th, the band of Caucasian adventurers who a year before had set up the so-called autonomous regime, had fled back to the U.S.S.R. Iran was again sovereign in its own realm.

Irac

Iraq is an independent state, governed by a limited monarchy. It is bordered by Iran to the east, Turkey to the north, Syria and Trans-Jordan to the west and Saudi Arabia and the Persian gulf to the south. Its area increased to about 175,000 sq.mi. after definition of the desert borders in 1932–33. The population was estimated in 1943 at 3,995,000, composed of the following categories: urban 600,000; dominantly agricultural 1,800,000; seminomadic 995,000; pure nomads (Bedouin) 600,000. Composition by races was as follows: dominantly Arabic stock 3,000,000; Kurds 750,000; Jews 88,000; Turkoman 75,600; Iranian 65,000; Assyrian 17,000; Armenian 6,000.

Baghdad, the capital city, had a population estimated at about 300,000. Other chief cities: Mosul (100,000), Basra (80,000), Najaf and Kirkuk (about 40,000 each), Hillah, Karbala, Kadhamain, Tel Afar (about 20,000 each) and Erbil (17,000).

Arabic is the predominant official language, spoken by 90% of the population. Kurdish is recognized in the

northeastern liwas as a secondary official language. It is spoken by about 20% of the population. Many people are bilingual or multilingual and in addition to Arabic speak Persian (15%) Turkish (6%) or Syrian and Armenian (only a few thousands in either case).

Islam is the dominant faith. In 1932, religious affiliations were estimated as follows: Shiah sectarians, 1,612,533; Sunni sectarians, 1,029,833. These figures should be increased about 25% for 1946, the former then being near 2,200,000 and the latter 1,450,000. Christians of various faiths (Chaldean, Jacobite, Nestorian, Gregorian and Protestant) numbered 135,000 in 1943. Yezides (devilworshippers) and Sabians (disciples of John the Baptist) numbered about 40,000 in 1946.

All vital statistics for Iraq were based on estimates of registrations in the larger cities and towns; there had never been a national census.

Eight prime ministers served Iraq during the decade 1937–46: Hikmat Sulaiman (Oct. 29, 1936-Aug. 15, 1937); Jamil Al Midfai (Aug. 17, 1937-Feb. 1940); General Nuri as Said (Feb. 1940-April 6, 1940); Rashid Ali Al Gailani (April 7, 1940-Jan. 29, 1941); General Taha Al Hashemi (Feb. 1, 1941-April 1, 1941); Rashid Ali Al Gailani (April 2, 1941-May 29, 1941); Jamil Al Midfai (June 1, 1941-Oct. 10, 1941); General Nuri as Said (Oct. 11, 1941-June 10, 1944); Hamdi Al Pachachi (June 12, 1944-Feb. 25, 1946); Tawfiq as Suwaidi (Feb. 28, 1946-May 25, 1946); Arshad Al 'Umari (June 1, 1946-Nov. 12, 1946); Nuri as Said (after Nov. 24, 1946).

Rule by Violence.—The deceptive calm of national life had been shattered on Oct. 29, 1936 by a military revolt. The swashbuckling Kurdish Gen. Bekr Sidqi, hero of the Assyrian "incident" and massacre of 1933, while directing manoeuvres of the army outside of Baghdad, treacherously murdered Jafar Pasha Al Askari, veteran commander in chief and leader of the Arab revolt, turned his army against the city, put the government to flight and masked the mailed might of army rule by the mild civilian government of Prime Minister Hikmat Sulaiman. Behind this façade, Sidqi gave Iraq a sample of army-political rule.

To many Iraqis, especially the younger elements, this departure from mediocre, nonrepresentative, somewhat inefficient and "city-politician" government was welcome. Four years earlier, when Iraq had gained independence, a relatively miniscule clique of those who had co-operated with British mandatory officials had entrenched themselves in government. In 15 years, 21 cabinets had been recruited from about 40 persons. The new government vigorously started a housecleaning. The long smouldering tribal revolts were largely suppressed. Inspired by the example of Turkey, a party of National Reform, boasting an ambitious scheme to modernize the land, was established. Warned by the Italian attack upon Ethiopia, Iraq hastened in 1937 to end her minor quibbles with neighbouring states and signed, along with Afghanistan, Iran and Turkey, the Saadabad pact, a treaty designed to safeguard the signatories from external intrigue or attack. But this whole scheme came to a dead stop Aug. 16, 1937 when a fellow Kurd, during manoeuvres in Mosul, cut short Sidqi's career with an assassin's bullet. His organization at once collapsed, and government reverted to the former group of aging political leaders who had survived the year.

There were many factors operating to undermine constitutional rule. Ranking officers to whom the taste of power had been sweet could not resist the temptation to dictate political affairs. Four of these banded together into the

The Grand Mufti of Jerusalem and former Premier Rashid Ali Al Gailani of Iraq during a public appearance in Germany on the second anniversary of the British occupation of Iraq in May 1943. Both anti-British figures had sought refuge in Germany

self-styled Golden Four (Golden Square). They gradually began to symbolize policies popular with many of the people. They were bitterly anti-British, claiming that British bases and advisers vitiated Iraq's freedom. They proclaimed that the Arab revolt had been only half won by driving out the Turk and should continue until the British and their agents had been made impotent. Their most emotional and potent plank was pan-Arabism, with its concomitant anti-Zionistic campaign. They rode the crest of the wave of nationalism which produced emotions akin to hysteria at times, and led to occasions of violence and bloodshed. In June 1938, Roger Cumberland, a U.S. missionary at Dohuk, was assassinated by a well-known Kurdish brigand whose gun was for hire. Eight years later the murderer, never having been arrested, still moved freely under the protection of those who instigated the crime. The crown, which under King Faisal I had served as a restraining and balancing element, under his son Ghazi practically ceased to play a significant role. The latter had not developed any capacity to reign. By 1938 rumours concerning palace life culminated in the establishment of a privy council to control the affairs of the royal family.

The German minister (Hans Grobba) and the Italian minister were subsidizing potential trouble, and their efforts were meeting with some success. In April 1939 King Ghazi, while racing his high-powered car at night, lost control and careened into a post. He was killed instantly. In Mosul violent elements twisted the news into a rumour that the British had murdered the king. They collected a mob which swirled down the streets to the British consulate and murdered George Monck-Mason the consul. Marked by such ominous incidents, the child Faisal II, then not quite four years old, was made king under the regency of his father's cousin and brother-in-law, the 26-year-old Abdul Ilah. The tide of anti-Zionistic fervour was flowing high, accelerated by the arrival the same

year of the refugee grand musti of Jerusalem. A local divine proceeded to issue a declaration of a holy war which culminated in the murder of several Jews in isolated streets. All this was combined with a sense of economic stagnation.

Revolt of the Golden Square.—Events in Europe tipped the scales in favour of the dissident factions. The unity of the political clique was broken by the defection of Rashid Ali Al Gailani, who in 1940 secretly aligned himself with the Golden Square. When World War II broke out, Nuri as Said obtained a diplomatic break with Germany, forcing Dr. Grobba to leave, but by means of the Iraqi minister to Turkey, the Golden Square remained in touch with Franz von Papen, the German ambassador at Ankara. In April 1940 they forced the regent to dismiss Nuri as Said and nominate Rashid Ali Al Gailani in his place. In Jan. 1941 they tried to force the regent to dissolve parliament, but the former fled from his capital and took refuge with a friendly army general at Diwaniyeh. Uncertain of what turn the war in Europe might take, Rashid Ali decided not to violate constitutional procedures until the spring offensive should indicate the relative strength of the British and German armies. Gen. Taha Al Hashemi was then named as premier, although it was freely predicted that a British show of strength would bring Nuri as Said back into office, while a German victory would cast the die in favour of Rashid Ali. On April 2, the Golden Square and Rashid Ali decided the time was ripe, forced Taha Al Hashemi to resign, set up their own government and attempted to give it the semblance of constitutional legality. The regent fled for sanctuary to Basra and then to Trans-Jordan. Although Rashid Ali declared his intention to abide by the Anglo-Iraq treaty, Article IV of which stated that in case of war Iraq would furnish Britain all facilities and assistance in its power, the British, noting movements of an axis disarmament commission in Syria and clandestine contacts with Von Papen in Turkey, decided to reinforce their bases at once. Encouraged by British reverses in Libya and the fall of Athens in Greece, Rashid Ali insisted upon a drastic limitation of British forces and on April 29 organized an attack upon the British positions in Basra and Habbaniya.

The British React.—Within a week Grobba and a few squadrons of German planes appeared on the scene, but the Iraq forces west of Baghdad were routed by R.A.F., Assyrian and Kurdish levies, strengthened by units from Palestine. These reached Baghdad on May 29 to find a city in chaos. About 350 Jews had been massacred, while for a month the European colony had lived in the British and U.S. legations under constant threats. The leaders of the short lived revolt scattered and fled either to Iran, where many were captured a few months later, or to Turkey and then to Germany. Subsequently all four colonels of the Golden Square were captured and hanged; but in Sept. 1945, disguised as a merchant, Rashid Ali escaped and smuggled himself into Saudi Arabia, where-he continued to live as an unwelcome guest of King Abdul

The political tempests had not disrupted fundamentally the civil or economic life of Iraq. The moderates again assumed office and began the difficult task of adjusting to a war world. Economic maladjustments arose, primarily in imported goods, which were apportioned by the Middle East Supply centre set up in Cairo. During 1942 as Allied aid began to flow across Iraq toward the U.S.S.R., a United States military mission appeared. Goods and services given by Iraq to the United Kingdom accumulated a credit of £150,000,000 (\$600,000,000) in the sterling balances, while

in the two years following March 1941 the currency circulation increased from Iraq dinars 6,623,291 (\$26,500,000) to about 34,000,000 (\$136,000,000.) During six years of war, the price level was held down to about 350%. Civilian agencies continued to operate almost normally, the health department successfully prevented any unusual or dangerous epidemics of disease, while the educational department announced an expansion of schools and a reduction in illiteracy in cities and towns. The same held true in other branches of the government.

Inefficiency and the black market bore down hardest on the peripheral tribes. At each stage of the transfer of short supplies, some would be diverted from their rightful goal. This resulted in a diminishing trickle of sugar, cloth, medicines and other rationed goods. The Kurds, always chafing under what they felt had been discrimination by the Baghdad politician-merchant, protested-but to no avail. Aroused by appeals from his mountain tribesmen, Mullah Mustafa jumped bail, assumed leadership of the Barzan Kurds and in Oct. 1943 precipitated a series of incidents that led to the dispatching by the government of a punitive military expedition. The latter was mauled in unfamiliar mountain terrain and retired, whereupon the British used their good offices to try and effect a reconciliation. An armistice was patched up, which the Kurds considered a victory even though it brought about little improvement in the general situation. Two years later, in Sept. 1945, Mullah Mustafa again incited the wrath of the government, which sent in a better trained force to capture him. His guerrillas stopped the army advance, but he was abandoned by his brother-in-law, who accepted government inducements to attack him in the rear. Accompanied by more than 1,000 of his fighters he crossed into Iran, where he was temporarily billeted with neighbouring Kurds, then busy establishing the Kurdish autonomous government in Iran. He was visited by soviet agents who helped him financially and gave him gifts of small arms before their departure. On Dec. 15, after having announced a Kurdish independent state based on the soviet model, he was captured by Iranian government forces. He was dressed as a general in the soviet armed forces and his followers also were outfitted as soviet

Iraq joined the Allies by declaring war on Germany in 1949. As a charter member of the Arab league (q.v.) Iraq showed a keen interest in and strong sympathy with Lebanon in the crisis of Nov. 1943, and later with Syria in May 1945. The Arabs of Iraq had always closed ranks with their fellow Arabs of Palestine, and as the question of increased Jewish immigration arose, the attitude of pan-Arabs became increasingly belligerent. The regent, gradually assuming a more important position, made an extended trip to the United States, returning via Great Britain and Turkey in the summer of 1945. There was some alarm during the winter of 1945-46 over soviet aims and methods when soviet tanks interfered with Iranian security forces, and autonomous states sprang up on Iraq's eastern border. A wary eye, thereafter, was kept on radical groups. Iraq remained friendly toward Great Britain. although nationalistic circles began demanding treaty revision, especially when French forces evacuated Syria in April 1946 and Egypt seemed about to get terms more in line with its desires for complete sovereignty. In 1945 Iraq sent a delegation to the United Nations conference.

In its internal policy, Iraq carried on with practically the same traditions as those of 1933-36. Political parties

740 of many shades of social thinking were recognized in March 1946. Those of socialistic tinge were small and considered largely indigenous.

Iraq emerged from World War II only slightly impaired. With her small population, her vast land and water potential and large sterling credits, Iraq possessed all the essentials for a rising standard of living, but political developments continued to divert attention to affairs abroad. The turor over Zionism unseated the government on May 30, 1946. The new prime minister Arshad Al 'Umari was noted for his energy, but also for his recklessness. After a strike in the Kirkuk oil fields on July 3, he fined, suppressed and clamped down on opposition, especially any coming from socialistic groups. Then in August, it was announced that the British were replacing and strengthening their garrison near Basra in anticipation of a possible collapse of security in connection with British oil installations in southwestern Iran. There was

talk of war to the east, to the west and the north. Iraq was one of the main points in the British strategic pattern covering the area stretching from the Adriatic sea to the Indus river. However, two events greatly eased the tensions just before the end of the year. Premier 'Umari was forced to resign, and the aged Nuri as Said, having served in 19 former cabinets, accepted his 9th term as premier. This relieved internal stresses while collapse of the sovietorganized regime in Iran on December 9–11 had a calming effect on international relations.

Ireland

See EIRE.

Ireland, Northern

Although an integral part of the United Kingdom, Northern Ireland acquired its own parliament for the control of the services transferred to it under the Government of Ireland act, 1920. Other services, including defense, foreign relations, inland revenue, customs and excise, and the post office, were reserved to the imperial parliament, to which Northern Ireland sent 13 members. Covering an area of 5,238 sq.mi., Northern Ireland comprises six counties (Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone) and two county boroughs (Belfast and Londonderry). It had in 1937 (official census) a population of 1,279,745. The estimated figure for 1946 was 1,332,000 (exclusive of persons serving in the forces). Chief towns: Belfast (cap., pop. 1937 census 438,086); Londonderry (47,813). Religions of the population at the date of the census: Roman Catholic 428,290; Presbyterian 390,931; Church of Ireland (including Church of England and Episcopal Church of Scotland) 345,474; other and not stated denominations 115,050. Governors: the duke of Abercorn (Dec. 8, 1922-Sept. 6, 1945); Vice-Admiral the Earl Granville (after Sept. 7, 1945). Prime ministers: Viscount Craigavon of Stormont (d. Nov. 24, 1940); John Miller Andrews (Nov. 26, 1940-May 1, 1943); Sir Basil Stanlake Brooke (after May 2, 1943).

Pre-war Problems.—Economic problems occupied a fore-most place in the public mind in 1937 and 1938. In June 1937 a bill was passed with the object of stimulating the establishment of new industries. This was the forerunner of post-war measures which resulted in the introduction of numerous manufactures of a lighter type as a supplement to Northern Ireland's basic industries—linen manufacture, shipbuilding and agriculture. By the end of 1937 the volume of employment was diminishing owing to the economic slump in the United States—one of Northern Ireland's best customers for linen goods—the dislocation of far eastern markets by the Sino-Japanese war, and the increasingly menacing situation in Europe. To alleviate the unemployment situation, parliament encouraged local authorities to undertake works of public utility.

During 1937, 44 schemes were approved by the ministry of labour at a capital cost of £900,000. In connection with the British government's rearmament program orders had been received by March 1938 for the construction in

Belfast of two cruisers and an aircraft carrier. These were the precursors of a large number of naval and other vessels built in Belfast during World War II.

On Dec. 6, 1938, the king's speech to parliament recalled a notable program of social legislation carried through in the previous session. Among the more important measures were a factories act, which made improved provision for the health, safety and general welfare of industrial workers, and a holidays-with-pay act.

After the coronation of King George VI in 1937, the king and queen paid a visit to Northern Ireland which called forth many public manifestations of loyalty and affection. But war clouds were already gathering ominously in Europe and on March 22, 1938, the Northern Ireland house of commons, on the initiative of the prime minister, Viscount Craigavon, adopted a motion assuring the British premier that "should any crisis arise he can confidently rely upon the people of loyal Ulster to share the responsibilities and burdens with their kith and kin in other parts of the United Kingdom and the empire to the utmost of her resources." This pledge was fully redeemed during the six years 1939–45.

The latter part of 1938 saw the first stages of plans for air raid precautions and civil defense which were later to be extensively developed. Discussions took place in the early part of 1939 between the British and Northern Ireland governments on the question of compulsory military service. Lord Craigavon strongly represented to Neville Chamberlain that the people of Northern Ireland desired to be placed under the same obligations as their fellow-citizens in the rest of the United Kingdom. Ultimately the British authorities decided that conscription should not be applied to Northern Ireland. Although, in consequence of this decision, recruiting in Northern Ireland remained on a voluntary basis, men and women came forward in large numbers and served gallantly in all branches of the fighting forces and the auxiliary services.

War Effort.—When war broke out in Sept. 1939 the Northern Ireland house of commons was immediately summoned and the prime minister announced Ulster's deter-

Funeral cortege in Belfast, Ireland, for Seán McCaughey, former officer of the outlawed Irish Republican army who died on May II, 1946 after a hunger strike in a Dublin jail. He and II other strikers demanded treatment as political, rather than treasonous offenders

mination to participate in the struggle to the utmost of its resources. Recruiting for the forces and civil defense went on apace, industry was progressively switched over to war production, and the farming community, in the first year of war, substantially exceeded the tillage "target" of an additional 250,000 ac. under food crops.

The expansion of agricultural production in Northern Ireland between 1940 and 1945 added enormously to the food supplies of the United Kingdom and so helped to defeat the axis attempt to starve the nation into surrender by means of the submarine campaign. The Northern Ireland ministry of agriculture became an extensive food production department controlling crops, livestock and other farm products. It was a huge marketing organization responsible for the purchase, sale and distribution to the retailer of most of the principal articles of food. By 1945 the ministry's financial transactions arising from its war services had reached an annual total of more than $f_{44,000,000}$. The tillage area was progressively increased until it reached approximately 900,000 ac. Simultaneously the cattle population was increased: the figure in 1944 was 885,000, compared with 753,000 in 1939. In addition home-grown supplies of flax, the raw material of the linen industry, were increased sixfold. The area under flax in 1944 was 124,000 ac. During 1945, 156,590 fat cattle, a record number, were shipped to Great Britain to help to maintain the meat ration there. The. value of these cattle exceeded $f_{4,822,500}$. The number of fat sheep sent was 17,158, value £56,047. Great Britain received from Northern Ireland in 1945, 270,000,000 eggs, valued at £3,750,000. Large supplies of milk from Northern Ireland helped toward meeting the shortage in Great Britain during the winter months. The 1944-45 figure of 24,000 gal. per day went up to 40,800 gal. per day in 1945-46. Potato shipments were no less remarkable. The figures for 1945 were: ware potatoes, 117,900 short tons, value £750,000; seed potatoes 83,195 short tons, representing another £750,000. Although pig production had to be cut down during the war owing to the shortage of feeding stuffs, bacon and hams valued at £140,352 were shipped to Great Britain in 1945.

By skilful organization and co-ordination Northern Ire-

land's war effort on the industrial front was carried to a high degree of efficiency. In the Belfast shipyards a vast program of new construction, conversion and repair work was carried out. No fewer than 170 warships of various types were built—aircraft carriers, cruisers and a great variety of other craft. Side by side with this activity the construction of refrigerated cargo liners and tankers proceeded apace. One of the most striking examples of conversion and repair work was the virtual rebuilding of the famous liner "Georgic," which was extensively damaged in the middle east in July 1941, and which was transformed in Belfast from a sadly battered vessel into a luxuriously appointed troopship.

Northern Ireland's aircraft factories poured forth a constant stream of bombing planes and flying boats. Some 1,500 heavy bombers were built and 110 Sunderland flying boats. The engineering industry made its impressive contribution in the form of tanks, guns and ammunition. In the textile factories more than 200,000,000 yd. of cloth were produced for the services and 90% of the shirts required for the forces were made in Northern Ireland. Two million parachutes were produced for the royal air force. The Belfast ropeworks manufactured one-third of the ropes produced in the United Kingdom for war requirements.

Strategically Northern Ireland was of the highest importance to the defense of the United Kingdom and to the successful waging of the battle of the Atlantic. Ports in Eire were not available for use by the royal navy, but the harbours of Belfast and Londonderry accommodated ships of the British, U.S. and Canadian fleets. Just before D-day quite an "armada" of warships and troopships sailed from Belfast lough for the invasion of Normandy. Northern Ireland was studded with aerodromes used by British and U.S. air units, and seaplanes based on Northern Ireland's inland waters maintained their daily and nightly patrols hundreds of miles out over the Atlantic.

Northern Ireland, indeed, came to be known throughout the world as "the British bridgehead" and "the Gibraltar of the north." Hundreds of thousands of British and U.S. troops received their training there. The first contingent of U.S. troops to enter the European theatre of operations landed in Belfast in Jan. 1942 and were welcomed by the governor, the secretary of state for air, representatives of the government of Northern Ireland and senior officers of the British fighting services.

In spite of its geographical position Northern Ireland did not escape the attentions of the German air force. The heaviest raids were on the city of Belfast—in April and May 1941—more than goo people being killed and some thousands injured.

The government of Northern Ireland maintained the closest touch with the imperial government on matters of policy and administration relating to the prosecution of the war. Similarly the Northern Ireland government worked in intimate co-operation with the British and U.S. forces through the service chiefs stationed in the country during the war years. In 1942 the king and queen again visited Northern Ireland, and on that occasion saw British and U.S. troops in training and Ulstermen and women at work in factories and shipyards.

Northern Ireland's war effort was officially acknowledged on May 6, 1943, by a letter from Winston Churchill, then Britain's prime minister, to J. M. Andrews, the Northern Ireland prime minister, in which he wrote of Northern Ireland's loyalty and devotion. In June 1945, in a letter

to Sir Basil Brooke, who had succeeded Andrews, he again thanked Ulster for its contribution to the war effort and referred to its loyalty and courage.

In July 1945 the king, the queen and Princess Elizabeth paid a victory visit to Northern Ireland. The king delivered a message to both houses of parliament and held an investiture in the great hall of parliament buildings. Princess Elizabeth revisited Northern Ireland in March 1946 to launch the aircraft carrier "Eagle" at the Belfast shipyards.

Finance and Trade.-To understand developments in Northern Ireland's finance during 1937-46, some basic facts in the financial relationship between Great Britain and Northern Ireland require explanation. Most of the taxation levied in Northern Ireland went direct to the British treasury. From the product of this taxation were deducted the amount of "transferred" expenditure (covering the whole field of social services, maintained in parity with Great Britain's standards, education, law and order, agriculture and fisheries, harbours and commercial services) and the cost of "reserved" services administered in Northern Ireland. The balance was retained by the treasury and was known as Northern Ireland's "imperial contribution." Between 1921-22 and 1938-39 this contribution averaged £1,616,000 per annum. By reason of the enormous increase in taxation for war needs the amount of the contribution rose to record figures, as the following details

Year												Amount of contribution
1939-40												
1941-45 (average) .	٠	٠.		٠			٠					25,630,000
1945–46 (provisional)												
1946-47 (estimated) .			_							_	_	22.500.000

The volume of Northern Ireland trade is shown by the following figures:

Year										Imports	Exports	Total Trade
1937										£57,115,000	£54,358,000	£111,473,000
1938										54,385,000	51,061,000	105,446,000
1939		٠			٠					58,683,000	58,290,000	116,973,000
1940				٠						78,338,000	79,632,000	157,970,000
1941						٠				81,079,000	81,681,000	162,760,000
1942	٠	٠							٠	102,647,000	87,379,000	190,026,000
1943			٠							101,584,000	99,678,000	201,262,000
1944	٠						٠	٠		103,881,000	111,133,000	215.014.000
1945	٠	٠	•	•						107,100,000	113,206,000	220,306,000

In considering the significance of the above table two factors should be borne in mind: changes in money values and the contrast between peacetime and wartime commerce during the decade under review.

Post-War Developments.—While the war was still in progress the Northern Ireland cabinet had been engaged in preparing schemes of reconstruction and development. In the latter part of 1945 and during 1946 the first fruits of these plans appeared. A long-term housing program was begun and a statutory body known as the Northern Ireland Housing trust made encouraging progress with the erection of houses for letting to the workers at reasonable rents. Steps were taken toward the expansion and modernization of the health and hospital services. A large-scale campaign against tuberculosis began in 1946 and a single authority for the whole of Northern Ireland was set up to combat the disease.

Many new industries established with state assistance under recent legislation began to operate, and others were being expanded. On May 23, 1946, the minister of commerce stated in parliament that the various projects so far dealt with would provide employment for some 14,000 workers.

Family allowances benefiting 100,000 families came into operation in Aug. 1946. Social services were extended and economic standards raised. A bill introduced in Oct. 1946 proposed far-reaching reforms in the educational

system. Other schemes taken in hand related to agricultural development, road and rail transport and electricity supplies.

In 1946 increasing attention was being paid to the welfare and training of youth. Many voluntary organizations engaged in this work received substantial grants from the ministry of education through the Northern Ireland Youth committee. (B. S. B.)

Iron and Steel

At the end of the decade 1937-46, production data were still lacking for the war years in many of the axis and occupied countries, so that as yet world totals were at best no more than estimates. The munitions programs of World War II demanded steel not only in greater quantities than ever before, but in quantities greater than had ever been contemplated as possible needs in any future war. The demands for steel were so great that they could not be superimposed on normal requirements, and as a result civilian requirements were cut to the irreducible minimum in order to satisfy essential war needs. At the beginning of the decade, anyone suggesting that in the event of another war, steel supplies would be so "tight" that the few tons needed to make hairpins would be restricted, would undoubtedly have been subjected to universal ridicule. Yet just that, and other things considered equally improbable, actually happened.

With so large a share of the war needs supplied by cuts in everyday civilian uses, the expansions in output required for the war were greatly reduced, and available figures indicated that world totals did not increase as much as might be expected. It was true that the war peak of steel production in the United States was nearly two-thirds greater than in 1937, but increases of that magnitude were not made in any other country. In fact, increases elsewhere than in the United States appear to have been relatively small and few in number, and considering the decreases in output that must have followed German occupation of practically all the steel-producing countries of continental Europe; the cumulative decrease was likely to offset a large part of the increases elsewhere. So far as could be determined, net increases were of the order of 15% to 20%, with the peak of production in 1942.

The amount of iron and steel produced outside the United States and Europe remained relatively small. In 1937 the United States produced 36% of the total pig iron, Europe 56%, and the rest of the world 8%. The advent of

the war called for increased supplies, but few European countries were able to meet the call. Two of the largest producers, Germany and Great Britain, were dependent on imported ores, the former for two-thirds of the supply, and the latter for one-quarter. For a time Germany was cut off from all imports except from Sweden, but later was able to obtain ores from the occupied countries. In Great Britain the nearby Swedish ores could no longer be obtained, and imports from more distant sources were hampered by shipping difficulties. Hence there were declines in output in the countries exporting ore. Eventually Germany, through occupation or domination, secured control of the iron and steel industry of most of continental Europe, but under conditions of forced labour in the occupied countries, outputs could not be kept up to prewar levels.

Iron Ore.—In Table I¹ there are presented the available production figures for all countries which at any time since 1937 had attained an output of 1,000,000 tons or more of iron ore. Production outside of these countries was small; those listed accounted for about 95% of normal output.

The most notable feature of the production table is the reduction of output in countries exporting ore, and in the occupied countries. Outside the United States, decreases and increases almost balanced, so that the over-all increase was determined by the United States.

International shipments of iron ore were resumed shortly after the close of the European phase of the war. The first shipments of Swedish ore to England were made in July 1945, and the first cargo of Chilean ore was received in the United States in August. Algeria showed a marked increase in activity in 1945, while Spanish Morocco was slower in recovery, and Tunisia showed little change. The Spanish output and exports were less in 1945 than in any of the preceding war years. In 1946, shipments to the United States were resumed from Sweden and Cuba. However, the main feature of the U.S. ore imports was the growing importance of Canada.

United States.—Supplementing the data in Table I, iron ore production in the United States decreased from 98,981,560 short tons in 1945 to 79,759,680 tons in 1946 (preliminary estimate).

Canada.—After the opening of the Steep Rock deposit in western Ontario, the iron ore output of Canada more

¹Data for this and the other tables of world production were necessarily accumulated from a number of different sources, some of which did not agree, but an attempt was made to produce a table as near consecutive as possible. Data were derived from the publications of the U.S. Bureau of Mines, the Statistical Yearbook of the League of Nations, the Statistical Annual of the American Iron and Steel Institute, and Iron Age.

Table I.—World Production of Iron Ore

than doubled. However, since this new production was exported to the United States, Canadian furnaces still imported the bulk of their ore supply from the United States.

Pig Iron.—Table II presents production data from all countries which at any time after 1937 had attained a pig iron output in excess of 1,000,000 short tons. The countries listed normally accounted for about 95% of the total output.

While pig iron production in the United States during the war years increased by one-half over the prewar rate, world output increased only a small degree. Difficulties in maintaining ore supply and in keeping an adequate labour force, especially in the German-occupied areas, led to declines that largely offset the expansion in the United States.

United States.—Blast furnace production declined 13% in 1945 as compared with the peak year of 1944. Normal production in 1946 was interrupted by steel and coal strikes, with the result that it fell to 45,378,530 short tons for the 12-month period. Demand during the year was well above production, and the reconversion program was hampered by the shortage.

Canada.—Blast furnace output in Canada was doubled during the war years, reaching a peak in 1942, and declining 10% by 1945. Output in 1946 dropped to 1,520,753 short tons, about 23% less than in 1945.

Great Britain.—While the British production of pig iron declined somewhat during the war years, the results could be considered good in view of the difficulties of securing iron imports, and the shortage of coal. It was notable that production increased in 1945, when most other countries were on the decline. Production totalled an estimated 8,779,000 short tons in 1946, about a 10% increase over the average rate of 1945.

the average rate of 1945.

Continental Europe.—The various European producers of pig iron may all be classed in one group, as all eventually suffered from partial or complete German occupation or domination. Even though blockaded from imports from without, the German-controlled areas had a self-contained potential production capacity that was formidably large, but labour was short at best. Forced labour both in the occupied areas and in Germany itself was notably inefficient, and outputs suffered accordingly. Then, as countries were liberated from the occupation, conditions became even more disorganized than before, and production in some areas was almost stopped.

The mills at Pittsburgh, like those of all major U.S. steel producing centres, began to operate on night schedules in the summer of 1939 to fill the rush of defense orders

As indications of the rate of postwar recovery, partial data for 1946 were reported so far as available.

In Belgium, production increased from 155,500 short tons in Jan. 1946 to 189,600 tons in June, with a total of 1,026,250 tons for the half year. In Czechoslovakia, production increased from 61,700 short tons in Jan. 1946 to 87,000 tons in June, with a total of 469,000 for the half year.

France's production increased from 213,000 short tons in Jan. 1946 to 335,000 tons in July, with a total of 1,804,000 tons for the seven months.

Conditions in Italy were still almost completely disorganized, with production even lower than in 1945. Luxembourg's production, however, increased from 84,000 short tons in Jan. 1946 to 137,000 tons in July, with a total of 754,000 tons for the seven months.

Production in Poland in the first five months of 1946 was 315,000 short tons, an average of 63,000 tons monthly, as compared with 81,600 tons monthly in 1939. In Sweden, production in the first half of 1946 dropped 5% below the average rate for 1945.

Steel.—So far as data were available, Table III presents steel production in all countries having an output over 1,000,000 short tons a year. The minor producers not listed, including Austria, Hungary, Spain, Finland, Rumania, Yugoslavia, South Africa, China, Brazil and Mexico, accounted for only about 2% of the total.

While the world totals were yet not definitely known, it was apparent that the increase during the war years was not large.

The 58% increase in the United States was largely offset by decreases in the European war zone, where shortages of ore restricted the output of pig iron necessary for the production of steel.

United States.—In order to assure a greater output of steel for war uses, production capacity was enlarged all along the line—ore, pig iron and steel. The record of the progress is shown in Table IV. In connection with the data on steel, it is important to note that while the figure usually emphasized is gross production of ingots and castings, the figure that really counts is the shipments of finished steel to consumers. The processing operations in the conversion of raw ingots into finished steel result in the removal of from one-quarter to one-third of the original

tonnage as scrap, with a corresponding reduction in the tonnage of finished steel. This scrap is remelted in subsequent operations, and so is not lost, but the constant reworking of this large volume of plant scrap inflates the apparent output, when measured in terms of raw steel, rather than as finished steel.

As will be noted from Table IV, there was a decline of 11% in steel production in 1945, and it was anticipated that something near this same level of operations would need to be maintained in 1946, but production was cut in January and February by a steel strike, and again in May and November by coal strikes. As a result the year's total was 66,590,604 short tons, a decline of about 16% below 1945. This restriction of output led to a shortage of supply throughout the year, and greatly hampered the return to normal industrial operation.

Canada.—Steel production in Canada more than doubled during the war years, reaching a peak in 1942, and declining 7% by 1945. In 1946, production was 2,334,631

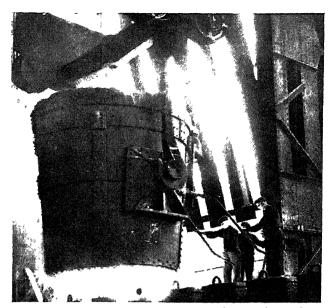

short tons, about 19% less than in 1945.

Great Britain.—Considering the difficulties in maintaining ore supplies and pig iron output, steel production in Great Britain was kept at a good level during the war years. There was a marked postwar improvement, with an estimated 14,372,000 short tons in 1946, or about 9% over the average rate of 1945.

Continental Europe.—With all of the continental steel producers eventually coming partly or wholly under German control, either by occupation or domination, steel output followed the trend established by ore supplies and pig iron output. Bad as conditions were under German control, in most cases they became worse with liberation, and for a period of several months the basic industries were almost completely disorganized.

The following data on operations during the first half of 1946 show the extent to which reorganization was put

British mill workers preparing to pour molten steel into huge moulds. Many units of the British industry were modernized to meet wartime demands for iron and steel used in shipbuilding, bridges, munitions and general construction work

into effect, and the steel industry put back on a production basis.

Production in Belgium increased from 60,000 short tons a month at midyear of 1945 to 170,000 tons in Jan. 1946 and 200,000 tons in June, with a total of 1,110,000 tons in the first half of the year.

Czechoslovakia's production increased from 35,000 short tons in June 1945 to 162,000 tons in May 1946, with a total of 870,000 tons in the first five months of 1946.

Output in France increased from 60,000 short tons monthly in Jan. 1945 to 255,000 tons in Jan. 1946 and 415,000 tons in July, with a total of 2,373,000 tons in the first seven months. In Luxembourg, production increased from 4,000 short tons in Jan. 1945 to 77,000 tons in Jan. 1946 and 130,000 tons in July, with a total of 920,000 tons in the first seven months of 1946.

Poland's production was revived early in 1945, and by the end of the year had reached 81,500 tons monthly. In 1946, output rose to 110,000 tons, with a total of 638,000 tons for the first five months. In Sweden, production in the first half of 1946 was 694,000 short tons.

Production in the British zone in Germany was 1,100,000 short tons in the first half of 1946. (See also Business Review; Metallurgy.) (G. A. Ro.)

Ironside, 1st Baron

Baron Ironside (Field Marshal William Edmund Ironside) (1880—), British soldier, was born May 6, 1880. He entered the royal artillery in 1899 and saw active service in the Boer war. At the outbreak of World War I he was a general staff officer, third grade, and by 1918 had advanced to brigadier general in command of the 99th infantry brigade in France. Shortly before the armistice he was transferred to Archangel, Russia, as commander in chief of the Allied troops there. A full general in 1936, he was appointed commander in chief of the eastern command, and in 1938 became commander in chief of British forces in the middle east. He was named governor and

commander in chief of Gıbraltar in Oct. 1938 and British inspector general of overseas forces in May 1939. At the start of World War II, he was chief of the British imperial general staff, but was replaced on May 26, 1940, after the German break-through in Flanders, and received command of the home forces. He was made a field marshal in 1940 and was created baron in Jan. 1941.

Irrigation

Shortly after the opening of the decade 1937–46, most of Europe and parts of Asia were in armed conflict and consequently engaged in destructive rather than constructive activities. Late in 1941, about the mid-period of this decade, all of the important nations of the world were drawn into war, resulting in almost complete cessation of civil improvements and the initiation of programs of production of the implements and supplies necessary in waging war. Therefore, fully seven of the ten years covered were devoted by each of the civilized nations principally to carrying on only such expansions as would produce larger yields of food and fibre to supply and maintain their armed forces, their allies and the life of the civil population.

U.S. Irrigation.—During the summer of 1936, severe drought had prevailed over the great plains area and part of the western United States. Areas protected by adequate water storage reservoirs and canal systems, however, suffered little. In many areas dependent on dry farming, more than 85% of the taxes were in default, while adjacent irrigated lands were practically free of tax delinquencies. In 1937 the U.S. bureau of reclamation started the fiscal year with its storage reservoirs generally filled and the lands of the federal projects amply protected against water shortages. Lake Mead, the reservoir created by the construction of Boulder dam, continued to fill, and at the end of the fiscal year 1936 contained 15,000,000 ac.-ft. or nearly one-half of capacity. Sufficient water was in reserve to serve irrigators of the Yuma federal reclamation project and the Imperial valley and other downstream irrigation projects for three years. The bureau of reclamation had 35 projects in 13 western states under construction during 1937. The major project of the bureau, then under construction, was the Grand Coulee dam of the Columbia basin project. The Bartlett dam on the Salt river project, Fresno dam on the Milk river project, Grassy lake and Crosscut dams on the Upper Snake river project, Boca dam on the Truckee river storage project and Marshall Ford dam on the Colorado river, Texas project were also under construction by the bureau during 1937.

During the year the irrigable area of federal projects increased 72,800 ac. and the irrigated area 76,614 ac. Although unit prices were low, the grand total of crop values amounted to \$118,658,272. The acreage within federal project boundaries amounted to 1,700,969 ac.

In 1938, large-scale construction began on the great Central valley project in California, greatest of the bureau of reclamation's remedial projects and designed to alleviate critical water shortage and problems in three important agricultural areas of the state through the conservation of waste flood waters of California's major streams. Through regulation of both the Sacramento and the San Joaquin rivers the Central valley project provided adequate water to supplement the irrigation supply of a large area of highly improved orchard and farm lands in the southern San Joaquin valley; re-established navigation to Red Bluff on the Sacramento river; prevented salt intrusion in the irrigation channels of the delta of the Sacramento—San Joaquin rivers; provided supplemental water for irriga-

tion, domestic and industrial uses in the Walnut creck-Martinez area, south of Suisun bay; and made possible the development of 250,000 kw. of electric power at Shasta dam. Construction was started on the Shasta dam on the Sacramento river 14 mi. north of Redding, Calif., to be 620 ft. high above foundations, 3,500 ft. long and to contain 5,610,000 cu.yd. of concrete. The reservoir created by Shasta dam in the Sacramento, Pit and McCloud rivers had a capacity of 4,500,000 ac.ft. of water.

Rapid progress was also made on the All-American canal of the Boulder canyon project. All sections of the main canals and all important structures were either completed or under construction at the end of the fiscal year. Imperial dam and desilting works at the head of the All-American canal were virtually completed. In Nov. 1938 work was started on the Green Mountain dam and power plant of the Colorado-Big Thompson project in Colorado. The dam site was located on the Blue river, Colorado. This was an earth and rock-fill structure, with a maximum height of 270 ft. above the bed of the river and a crest length of 1,300 ft.; the reservoir capacity was 152,000 ac.ft. The Colorado-Big Thompson project was designed to provide a supplemental water supply for 615,000 ac. of land already under cultivation situated east of the Rocky mountains in Colorado with water collected and stored on the western slope of the mountains in the headwaters of the Colorado river. The layout provided for this stored water to be transported through the continental divide in a tunnel 13 mi. long to the headwaters of the Big Thompson river, where it would be restored for release as needed for irrigation.

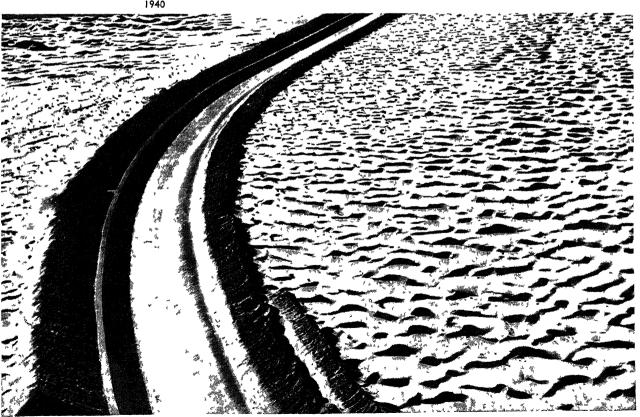

On the Central valley project, Calif., the bureau of reclamation started construction of the Friant dam on the San Joaquin river, designed to be 320 ft. high, 3,430 ft. long and to create a reservoir of 520,000 ac.ft. capacity. Also on

Aerial view of the All-American canal, as it appeared before it began to supply water to the Imperial valley, California, in Oct.

the Delta division of the Central valley project, the three contracts for the construction of the second and third sections of the Contra Costa canal and four pumping plants were completed. The 80-mi. All-American canal was completed. This canal, with its 130 mi. Coachella branch, carried water to irrigate 1,000,000 ac. of land in the Imperial and Coachella valleys of southern California. Reservoirs of the bureau of reclamation at the close of the fiscal year 1939 had a combined capacity of 51,215,000 ac.ft. Also at the close of the year it was operating 24 power plants in connection with its irrigation operations and had sold 3,211,355,667 kw.hr. resulting in a gross return of \$7,866,-994. There was some increase in the area in cultivation, from 3,040,695 ac. to 3,078,072 ac., but nearly all the increase of 37,377 ac. resulted from the addition of the Burnt river and Stanfield projects in Oregon and the Humbolt project in Nevada which appeared in the bureau's crop tabulation for the first time.

By 1940, the bureau was prepared to serve irrigation water to 4,168,168 ac.—an increase of 278,628 ac. over that reported in 1939. The crop returns from the 3,316,030 ac. of land in cultivation actually irrigated in 1940 were valued at \$117,788,677. The average crop value per ac. of \$35.52 was \$1.54 per ac. less than the 1939 record. Under the construction program for 1940, operations of the bureau were to be extended to about 2,370,000 ac. of land to be brought into cultivation. The largest development in this program was the 1,200,000 ac. to be included in the Columbia basin project.

Precipitation for the water year 1940-41 was the best in a generation, so that all storage reservoirs started out with a full supply for the 1941 irrigation season. The 73 reservoirs in operation on the bureau's projects in 15 western states on June 1 contained 41,500,000 ac.ft. of water. Lake

Mead at Boulder dam on June 1 contained 28,000,000 ac.ft. and by the end of June contained more than 30,000,000 ac.ft. All 5 of the reservoirs on the Salt river in Arizona reached their maximum capacity of 1,894,000 ac.ft. contrasted with 22,000 the year before.

The final bucket of 9,926,005 cu.yd. of concrete was placed in the Grand Coulee dam in Dec. 1941. Deer Creek dam on the Provo river, Utah, was completed in Oct. 1941. Operation of the All-American canal was extended throughout the Imperial valley during the fiscal year; 81 mi. of the 131 mi. Coachella branch canal were completed and structures on 41 mi. were completed.

During the fiscal year 1942, the bureau of reclamation completed construction of Grand Coulee, Friant dam of the Central valley project, Calif.; Vallecito dam, Pine river project, Colo.; Marshall Ford dam, Colorado river project, Tex.; and the Deer Creek dam, Provo river project, Utah. Because of the war efforts of the nation, the emphasis in the fiscal year 1942 was on facilities which would produce power for war industries. Expenditures, however, were also directed toward completion of facilities which would benefit irrigation directly through additional storage, thus increasing the nation's food supply. The installed capacity of 30 power plants on the bureau's 19 projects in 11 states was practically double that of 1941. The projects constructed or served by the bureau produced crops of a value of \$272,048,516 during the calendar year 1942. This for the first time included the \$38,163,991 value of crops produced in the Imperial valley of California, wholly served for the first year by the All-American canal of the Boulder dam system. The over-all cultivated acreage rose from 3,380,460 in 1941 to 3,877,072 in 1942. Most of the increase was due to the inclusion of the approximately 411,000 ac. of the Imperial Irrigation district.

For the 1943 season, farmers of the nation diverted their efforts from the less essential to the more important food and fibre crops necessary for the support of the industrial and military activities of the United States and its allies. This was consequently also true of all farmers of the irrigated areas of the west. Record plantings of reclamation projects and consequently higher crop yields resulted. Potato yields increased by 52% over 1942, to 64,045,000 bu., beans 23% to 4,175,800 bu. over the preceding year and alfalfa for beef and dairy herds also went to a new high at 3,508,000 tons. The expansion was due both to the concentration of farmers on the more important war crops and to the increase in irrigated acreage. The 4,055,329 ac. served by bureau of reclamation facilities on 44 projects in 15 states, produced, in 1943, 10,660,000 tons of food and forage crops valued at \$388,671,000. The gross returns were 43% or \$116,622,453 greater than in 1942.

During the fiscal year 1943, Shasta dam, second largest concrete structure in the world, was completed. Construction activities were retarded on most of the bureau's projects, however, as a result of the War Production board's stop-construction order issued in the fall of 1942.

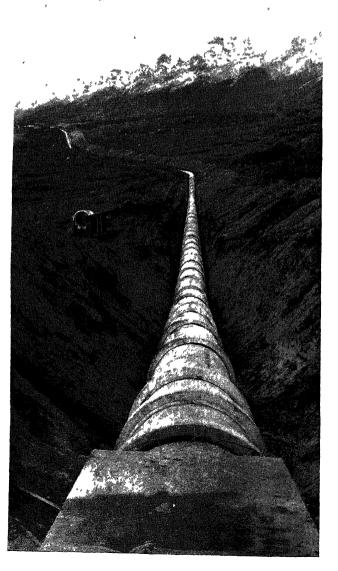

During 1944, the 13 mi. tunnel of the Colorado-Big Thompson project (Colorado) was "holed through," and work proceeded on lining it. Construction was centred on the Altus, Oklahoma and Tucumcari, New Mexico, projects in Texas. Work on the Anderson Ranch dam on the Boise project (Idaho) passed the halfway mark. The power plant at Shasta dam, completing its first full year of operation, generated 739,000,000 kw.hr. of electricity. Millerton lake, the reservoir created by Friant dam (Calif.), reached full capacity and overflowed the spillway of the dam in

late June. The reservoir in 1944 provided water for irrigating 32,500 ac. of land for crops and 110,000 ac. of pasture land for more than 140,000 head of cattle. Release of water from Shasta reservoir helped provide for irrigation needs in the Sacramento valley, enabled farmers to double the acreage of rice and helped protect \$14,500,000 worth of crops from salt water intrusion in the delta.

Power output from the plants operated by the bureau of reclamation from its great irrigation reservoirs in the west totalled almost 14,000,000,000 kw. during the fiscal year 1944–45. Most of the power went into production of planes, tanks, ships and other commodities to sustain U.S. fighting forces in all parts of the world. While devoting major attention to its programs in support of the war effort, the bureau also made substantial progress on its plans for undertaking a greatly expanded program for development of western resources during the postwar period.

Work was started in 1946 on the great Delta-Mendota canal, key link in the chain of water courses comprising the irrigation system of the Central valley project. The canal was designed as a concrete-lined river 100 ft. wide and 15

Salt Lake aqueduct, showing a pipe-line section under construction in 1945. It was part of the U.S. bureau of reclamation's Provo river project in Utah, built to irrigate lands along the eastern Salt Lake valley and to supply water to Salt Lake City

ft. deep, to carry Sacramento river water from the Delta into the depths of the San Joaquin valley, a distance of 120 mi. At Mendota it would collect in the Mendota pool, a reservoir to feed San Joaquin river lands, left short of water after the Friant-Kern canal diverted most of their water down to the dry country in Tulare and Kern counties. Work was continued on the 156 mi. Friant-Kern canal, to extend from Millerton lake, the reservoir created by Friant dam, to the Kern river near Bakersfield, Calif., providing water for irrigating 358,000 ac. of new land in the San Joaquin valley and supplemental water for an additional 374,000 ac. threatened by shortages.

Turlock Irrigation District.—The Turlock district was organized to provide irrigation, drainage and power to the area between the Tuolomme and Merced rivers in Stanislaus and Merced counties, Calif., covering about 200,000 ac. The district was formed in 1887 under the Irrigation act of California.

The irrigated area was increased from 142,756 to 153,873 ac., and the number of irrigators increased from 5,183 to 5,832 during the decade 1937-46. The average holding, excluding city and town lots, was about 30 ac. in 1946. The principal crops were alfalfa 36,290 ac., ladino clover 29,914 ac., orchard 15,304 ac., vines 14,053 ac., beans 17,000 ac. and grain 19,000 ac. There was not much variation in the crop acreage, except that ladino clover had increased from 4,248 to 29,914 ac.

Irrigation water diverted from the Tuolomme river into the main canal of the district increased from a total of 455,118 ac.ft. for the season of 1937 to an estimated 588,295 ac.ft. for 1946. Expenditures for irrigation canal enlargement including concrete lining amounted to \$760,000 during the 10 years.

The drainage system controlling the ground water level in the district comprised 146 deep well pumping plants and some open ditch drainage at the end of the decade. The capacity of the pumps varied from 900 to 2,200 gallons per minute; the average depth of well was 178 ft. The pumped water was carried by concrete pipe lines to the gravity canals where it became a part of the irrigation supply. During the 1937 season, the drainage water pumped from wells amounted to 144,013 ac.ft., as compared with 185,475 ac.ft. in the 1946 season. The number of pumps in 1937 was 125. Drainage construction costs amounted to \$162,000 during the decade.

More than 300 improvement districts had been formed in the Turlock district by 1946 for the purpose of concrete lining and piping the community ditches and for the construction of surface drains required principally in pasture irrigation. These improvement districts were formed by at least two-thirds of the landowners on any community ditch signing a petition for an improvement. The Turlock district, after a public hearing, formed the improvement district, let a contract for the work required and provided the financing. The landowners affected paid back the cost of the work in 10 annual payments with 4% interest on deferred payments. The Improvement District act of California made possible the construction of irrigation and drainage improvements by the owners of land directly benefitted, and fixed the ownership and responsibility of the improvement with these owners rather than with the Turlock district as a whole. The number of improvement districts increased from 120 to 317, the expenditure for works from \$484,218 to \$1,550,402 and the mi. of concrete lined and piped ditches from 97 to 246.

The district in 1946 generated power at two hydroelectric plants on the Tuolomme river and had long-term contracts with the Pacific Gas and Electric company of California for the sale and the purchase of power. The district's electric distribution system was extended over the area of the district and exceeded 775 mi. in 1946. In 1937 the district had 649 mi. of distribution lines. At the end of the decade, the district had 9,911 active customers as compared with 6,600 in 1937. Expenditures for construction of the electrical system during the decade amounted to \$1,632,000.

The bonded debt of the Turlock Irrigation district was reduced from \$5,402,180 to \$2,753,600 during the decade; the assessed valuation increased from \$13,393,650 to \$14,277,695 and the tax rate reduced from \$2.50 to \$1.00 per \$100 valuation. Total assets of the district amounted to \$14,000,000 in 1946 including a cash reserve of \$700,000; in 1937 they amounted to \$11,661,000. Estimated gross income for 1945 was \$35,934,965.

The Turlock, Modesto and Waterford Irrigation districts and the city and county of San Francisco claimed all of the waters of the Tuolomme river. The Turlock district entered into an agreement with the Waterford district to supply that district with water when available. Turlock and Modesto districts and the city and county of San Francisco entered into agreements of co-operation in the operation of storage reservoirs and in future developments on the stream. Storage capacity owned by the districts and the city and county of San Francisco in 1946 amounted to 750,000 ac.ft.

Work was started on the Cherry valley project (\$22,000,000). The districts and the city expected a substantial contribution to this project from the federal government for the flood control benefits which could be accomplished by operation of the five Tuolomme river reservoirs for flood control. Final regulation and control of the Tuolomme river would be accomplished by construction of the new Don Pedro project, which would add 1,000,000 ac.ft. of storage capacity, necessary to iron out the great variation in annual flows of the river.

Imperial Irrigation District.—The Imperial Irrigation district located in Imperial valley, southern California, was obtaining its entire water supply from the 80 mi. long All-American canal at the end of the decade. Complete service began in Feb. 1942. The district's irrigated area increased each year from 1937 to and including 1946, when it totalled 466,980 ac., an increase of 5,112 ac. over the area irrigated in 1945. Crop values increased annually after 1939, when the value was approximately \$30,000,000; in 1940 they were \$32,000,000; 1941, \$34,000,000; 1942, \$38,164,000; 1943, \$58,540,000; 1944, \$61,706,000; 1945, \$64,233,000 and 1946, \$70,000,000. The most significant changes in crop change was in the acreage of flax in the valley. By 1943, there were 144,000 ac. cropped to flax, and production was 1,419 carloads. This receded later to an annual average of about 55,000 ac. of flax. The 1946 March crop summary anticipated an increase in sugar beet acreage to 25,000. The industrial expansion of the valley was as follows: 1938, \$150,000 alfalfa mills; 1940, \$150,000 rice mills; 1942, \$250,000 dehydration mills; 1944, \$200,000 alfalfa mills; 1945, \$3,000,000 sugar refinery; 1946, \$2,500,ooo alcohol plant. In 1946 there were 56 produce packing sheds in the valley. The All-American canal was to allow for the eventual development of east and west mesas adjacent to the Imperial valley. In 1942 the Imperial Irrigation district acquired those areas by incorporation within its boundaries. This inclusion aggregated 270,130 ac. and brought the gross area of the Imperial Irrigation district to 882,788 ac.

Water pipe line of stone and brick under construction in Mexico during 1945. It was built to bring water from the Toluca region to relieve the shortage in Mexico City and also to provide the capital with irrigation and hydroelectric power

Merced Irrigation District.-The Merced Irrigation district in 1946 had a gross area of 164,395 ac. within its boundaries, of which 143,075 were subject to irrigation requirements. The entire water supply was from the Merced river, where the Exchequer dam provided storage of 281,200 ac.ft. at Lake McClure. The hydroelectric plant, consisting of two 15,625 kw. generators, had an average annual output of 125,000,000 kw.hr. The power so generated was sold to the Pacific Gas and Electric company at the switchboard. From 1937 to 1946, the actual irrigated area increased from 87,000 to approximately 100,000 ac. The acreage in permanent pasture increased 1,600 ac. in 1937 to 27,000 in 1946. The number of mi. of concretelined canals and pipe lines increased from 72 to 106. This left 607 mi. of unlined or earth canals in the district. The drainage wells in operation, necessary on all well-designed irrigation systems, increased from 87 in 1937 to 103 in 1946.

The district planned to concrete-line and pipe another 50 mi. of its canals within 5 years, to install about 25 more drainage wells and replace wooden canal structures with concrete as the wooden structures wear out. There were no plans to expand the service acreage, but through better land preparation by the irrigators, concrete canal lining and installation of wells, the district hoped ultimately to irrigate 128,000 ac. The expansion would come from lands already within the boundaries of the district.

Modesto Irrigation District.—During the ten year period 1937–46, the Modesto Irrigation district did very little major construction. The principal improvements to the irrigation system were pipe lines constructed on private ditches by groups of irrigators operating as an improvement district, or individuals improving their own irrigation system. Total expenditures by improvement districts as payments to contractors amounted to \$698,000, which replaced 100 mi. of open earth ditches with 24 mi. of con-

crete-lined ditches and 76 mi. of concrete pipe lines. No data were available on the amount or cost of improvements made by individuals. During the ten year period, the Modesto Irrigation district spent \$253,000 on concrete lining of canals and laterals, and increased the length of lined canals from 33 to 51 mi. Three additional deep well drainage pumps were installed, bringing the total pump installations to 77 in operation in 1946 to help control the ground water table. Plans were made for a much expanded canal-lining program to enable the district to improve distribution of the irrigation water supply, insure against failure of canal banks and decrease maintenance costs. Very few wooden structures still remained in the canal and lateral system, and those few were being replaced with reinforced concrete as rapidly as possible. From 1936 to 1945 the irrigated area of the district increased from 68,588 to 70,759 ac. The changes in acreage of the principal irrigated crops raised in the Modesto Irrigation district from 1936 to 1945 were as follows: Alfalfa from 14,108 to 14,517 ac.; beans, 14,306 to 5,843 ac.; grain, 15,540 to 6,928 ac.; trees, 12,201 to 16,615 ac.; vines, 9,124 to 9,892 ac.; ladino clover, 1,708 to 13,998 ac.

Canada.—The greatest decline in cereal production in Saskatchewan took place in localities of low moisture and of lighter soil types. Many of such localities became partially abandoned. To prevent a widespread migration of settlers from the prairie areas, interest was increased in irrigation in western provinces, mainly in the large irrigated blocks of southern Alberta. Small individual farms were practically nonexistent.

The federal government had passed an emergency measure in 1935 known as the Prairie Farm Rehabilitation act,

but a full-scale program under it had not yet gotten under way. An intensive program was commenced in 1937. In the following ten years the federal department of agriculture, through the Prairie Farm Rehabilitation act, established a widespread program of water development and irrigation. The policy was varied. The department bore the full cost of large storage reservoirs and main canals for irrigation projects; it paid the full cost of storage projects serving communities; it paid, by grants, a share of the cost of constructing individual irrigation systems, storage dams and farm reservoirs or ponds, known in the region as "dugouts."

Through this program, the area under irrigation increased to 715,000 ac. by 1946. The full use of all this acreage was not yet attained at the end of the decade because of war problems, particularly those relating to labour and equipment. Full use of such acreage was possible in the immediate postwar period. In accomplishing this, the administration assisted in the construction of over 60 large water storage projects; 3,641 irrigation projects for use by individuals; 10,548 reservoirs for use by individuals; and 28,763 farm ponds or "dugouts." The results of the water conservation program in general, and the increase of irrigable acreage in particular, played an important part in Canada's increased production for the period 1937 to 1946. The results also had a very stabilizing effect upon agriculture and settlement, especially in districts where conditions had become unstable during the previous ten years. Farmers with an adequate supply of water became more permanent producers, and cereal production of western Canada increased greatly. In 1937, the production of wheat, oats, barley and rye amounted to a combined total of 373,897,000 bu. with a value of \$250,014,000. In 1945, the yield of these grains amounted to a combined total of 710,630,000 bu. with a value of \$543,638,000.

Continuation of this program was contemplated with a minimum objective of approximately 5,000 projects per year for the succeeding 5 years. In addition to the general program there was contemplated, if labour and material became available, the construction of several large storage reservoirs on the South Saskatchewan river and its tributaries. Completion of the contemplated program was estimated to double the existing area under irrigation, or bring it to approximately 1,500,000 ac.

Australia.—In the 1937-38 annual report of the State Rivers and Water Supply commission (Victoria) it was reported that the Red Cliffs and Merbein Irrigation and Water Supply districts were supplied with water from the River Murray by means of high-lift pumping plants, the station at Red Cliffs having the greatest capacity of any pumping station in Australia. Irrigation water pumped for Red Cliffs during the year amounted to 36,299 ac.ft. and for Merbein 28,951 ac.ft., these volumes being greater than the quantities for the previous year, and also in excess by some 5,000 ac.ft. for Red Cliffs, and 2,500 for Merbein, over the yearly average pumped. No serious setbacks were felt by growers, and, from a production point of view, both districts experienced one of the best seasons for many years. A total quantity of 33,000 tons of dried fruits were harvested, 20,000 tons from Red Cliffs and 13,000 from Merbein.

The first stage of the conversion of the Merbein pumping plant from direct steam engine-driven pumping units to electric motor-driven pumps was completed and on load for the first irrigation, which commenced in Sept. 1937. This unit, comprising one-third of the total capacity of the station, was on load for the maximum hours during the season and delivered 12,548 ac.ft. of water. The elec-

trical energy supplied from the Red Cliffs generating station for this unit at Merbein was 1,562,000 units for the year.

The State Rivers and Water Supply commission report also referred to the progress made in the then proposed Murray Valley Irrigation district, which was designed to consist of an area of 400,000 ac., extending from near Yarrawonga towards Cobram, Strathmerton, Picola and Numurkah. The plans provided for diversion of waters from the River Murray through various channels and canals, the length of which was to approximate 500 mi. Progress on construction of the channels was reported for the year.

The commission's 1944-45 report on the Red Cliffs and Merbein districts called attention to the extremely dry condition for that period and reported 45,777 ac.ft. pumped on the Red Cliffs district and 43,043 ac.ft. pumped in the Merbein district. Although there was some loss of crop because of frost and labour and fertilizer shortages, these two districts produced 24,893 tons of dried fruit during the year as compared with the two previous years of 33,543 and 31,895 tons respectively. The record production for those two districts amounted to 34,000 tons in 1939-40. The 1944-45 report indicated that, of 270,000 ac. which would ultimately be included in the Murray Valley Irrigation district, constituted in 1939, an area of 103,238 ac. had been reticulated for the 1944-45 season, and water rights totalling 22,291 ac.ft. had been apportioned to these lands.

In all of the Australian irrigation systems, the commission reported the irrigation of 665,200 ac. during the year 1945-46.

New Zealand.-Because of a generally abundant rainfall elsewhere in New Zealand, the practice of irrigation was confined to two distinct localities in the South Island, where as a result of the location of a lofty mountain range across the usual path of moisture-bearing winds, portions of the country lying on the lee side were poorly served by rainfall. As in many countries, the practice of irrigation followed the use of water for alluvial mining. The mining term "race" in lieu of canal endured and became used throughout the country, even for modern irrigation works. Many of the old mining races were converted to the use of private irrigators, but there was no widespread tendency for private interests to develop irrigation on a large scale. Realizing the possibilities from a production point of view, the government in 1941 embarked upon a policy of state development. Although this district has a low rainfall, it is plentifully supplied with streams, most of which are snow fed. The main streams lie deep in the valleys and, by 1946, had not been utilized for water supply, the smaller streams providing better diversion facilities and reasonably cheap storage. The irrigated acreage in this region increased from 3,200 ac. to 53,000 to the close of 1945.

In 1932, an intensive research had been conducted to determine whether irrigation would prove feasible for the Canterbury plains, and it was decided to proceed with the development of irrigation to encourage closer settlement and increase production. From 1934 to 1946 a comprehensive construction program was undertaken with the result that by the latter year, water was available for 51,000 ac. and irrigation works covering a further 44,000 ac. were at hand. On some projects water would be made available to only a portion of the total irrigable area, but never less than 50%. Approximately 1,000,000 ac. of the Canter-

bury plains were suitable for irrigation and would benefit from it. As for water storage, in the summertime the same weather conditions that cause the hot dry winds in the plains area also provide a heavy rainfall in the catchment of the rivers which traverse the plains, with the result that the maximum discharge of the rivers occurs during the irrigation season. The streams carry a great deal more water than is required for irrigation, consequently storage dams are not necessary and adequate supplies are available by direct diversion. In 1937, the Red Cliff project on the Waitaki river was completed to irrigate 4,600 ac. In 1938 the Levels plain project on the Opiki river was completed to irrigate 12,800 ac., and in 1946 the Ashburton-Lyndhurst project on the Rangitata river was completed; water was supplied for 34,000 ac. with an irrigable acreage of 64,000. The Mayfield-Hinds project on the Rangitata river was also in process of expansion; water was to be supplied for 44,000 ac. with an irrigable acreage of 87,000 ac. Two more projects on the Rangitata river with an irrigable area of 115,000 ac. and one of the Rakaia river with an irrigable area of 145,000 ac. were planned.

Iran.-Iran is probably the oldest irrigated country in the world. So far as reliable scientists could determine, the largest irrigation canal system ever built anywhere in the world was put into operation in southwestern Iran, probably before 1,000 B.C. The entire Karun river, largest in Iran, was probably diverted at a point near the modern city of Ahwaz, where canals were excavated on either side of the river. The canal on the east side was more than 63 mi. long and approximately 721 ft. wide at a point about 3 mi. below the intake. The canal on the west side had similar dimensions and covered a vast area of silt lands extending all the way down to the vicinity of the confluence of the Tigris and Euphrates rivers. These canal systems remained in complete ruin for more than 1,000 years, and there was no sign of use in 1946. In the meantime, the country survived by virtue of the development of small irrigation projects scattered throughout the country. Most of the development was made independently by individual owners, who in the majority of cases developed their water supply from underground by digging underground channels known as kanats (wells).

Surface streams in the interior of Iran are very limited in capacity and most of them are intermittent, flowing for only a short time in early spring during the period of most heavy precipitation and during the time of snow melt in the mountains.

In 1939-40, two projects were constructed or were under construction in the vicinity of Kermanshah, on the headwaters of the Karkheh river. At Shabankareh in southern Iran, about 90 mi. north of the ancient port of Bushire, a diversion dam was built in 1942, but the canal system was not completed until 1943-44. This project comprised approximately 49,000 ac. It included 22-odd villages that had formerly subsisted largely on dates produced along the fringe of the area where a limited water supply was available by various means of development. The new project provided possibilities for expansion. It also provided possibilities of ultimate ownership of lands by the peasant farmers. The climate of this project is tropical, and the crops cover a wide variety of products-with wheat as the principal crop and cotton as a secondary crop. During 1944-45, surveys were made for developing a very large project in the vicinity of Tehran. It was proposed to build a dam approximately 400 ft. high for storing water on the Lahr river at the base of Mount Demayend.

Normally the Lahr river discharges into the Caspian sea, but it was proposed to drive a tunnel some 3.1 mi. long through the mountain range to deliver the water of the reservoir to lands south and east of Tehran. The water supply would be sufficient for development of about 247,000 ac. of land. This would also supplement existing developments on the Varamine plain, sparsely irrigated by flood waters of Djarje Rud.

The project would also provide hydroelectric power for all of northern Iran, since the water supply would fall through an elevation of more than 2,000 ft. before being used for irrigation.

During the 1944-45 period, plans were also made for development of Zaindeh Rud, which supplied water for the lands above and below Isfahan, the ancient capital of Iran. This valley is about 155 mi. long. Plans were made for developing a series of storage dams along the river and a tunnel through the high mountain range to carry waters from the Kurang river, a tributary of the Karun. One of the most important advantages of this project was the control and distribution of the waters of Zaindeh Rud by providing impartial distribution. It was possible to mature crops throughout the entire length of the valley and to prevent famine during dry years when the water would have been consumed by the upper water users leaving the lower half of the valley dry during summer months.

India.—During the irrigation season 1937–38, the total area irrigated in all of the provinces of India under state projects amounted to 32,433,000 ac. as compared with an average of 28,968,500 ac. irrigated for the triennium 1934–37. Of this total, Punjab was first with 12,291,800 ac. irrigated, Madras next with 7,565,100 ac. and United provinces third with 5,163,800 ac. Sind was fourth with 4,849,300 ac.

In 1939, the total acreages irrigated in these same provinces amounted to 33,433,000 ac., with the Punjab, Madras, United provinces and Sind remaining in the same order as in the 1937-38 season. The principal construction projects completed in the year were the Kistna East Bank canal in the province of Madras and the Nira Right Bank canal in Bombay. In 1940, work was started on Thal project as the Haveli project was opened. Because of the great quantities of silt carried in the canals of this area, particular attention was given to desilting works to be included in the plans of conveying channels. Construction of irrigation works began to slow down by 1941, so that the Central Board of Irrigation of India emphasized research and the production of crops over the construction of works during this and the next several years. They did, however, continue work on projects already started-particularly the India-Sarda canal extension, involving more than 350 mi. of new canals. From 1941 to 1946, only those works necessary to produce better and larger crops were kept under construction. By 1946, of the total of about 70,000,000 ac. of land irrigated annually in India, 65% or about 45,000,000 ac. were managed by the government. (See also Dams.)

Isaacs, George Alfred

Isaacs (1883-), British labour leader and politician, was born May 28, 1889, in London, the son of a newspaper printer. At the age of 12, he got a job as office assistant in a newspaper plant. Later he became a printer's assistant and became prominent in trade union activities. In 1922, he was elected to parliament on the Labourite ticket, serving through 1923 and 1924. In 1929, he was again elected to parliament, but lost his seat in the general elections of 1931, and was not returned to Commons until 1939. During World War II, Isaacs became parliamentary secretary to A. V. Alexander, then first lord of the admiralty, in 1942. In 1944, he was appointed chairman of British Trades Union congress and in July 1945, Prime Minister Clement Attlee selected Isaacs as minister of labour and national service. Isaacs, who was in charge of demobilization, announced in Oct. 1945, his military discharge plan which called for release of 1,500,000 personnel in the armed forces by the end of 1945 and another 1,500,000 by June 1946. He subsequently told Commons May 30, 1946, that the wartime draft would be continued through 1946 but stated that only 18-year-olds would be conscripted in 1947.

Islam

Beginning in the early 19th century, the intellectual and social development of the Islamic peoples was marked, in all except the most backward countries, by a growing indifference to religion among the educated classes brought up in lay and Christian missionary schools. This was accompanied by the growth of lay nationalism, of socialism and of other doctrines attempting to place social and political organizations upon a nonreligious basis, thus coming explicitly or implicitly into conflict with the claims of Moslem law. Either complete agnosticism and even "anticlericalism" resulted, or else an attempt to free Islam of its "trapping" and "outmoded doctrines," and to develop a liberal modernist Islam. At the same time there was a tendency to cast aside traditional ideas and practices in such matters as the seclusion of women, and in certain of the non-Arab Moslem countries, such as Turkey and Iran, an attempt to abandon Arabic words and idioms and other signs of Moslem and Arab influence. It was true that orthodox Moslem teaching continued, that the influence of Moslem ulema in politics and society was still strong, and that popular religious enthusiasm still persisted, but it was generally assumed that religious fanaticism would decline with the spread of enlighten-

The years 1937-46 saw a continuation of these tendencies. In Turkey the official basis of the state was still nonreligious. In Palestine, Syria and certain of the other Arab countries where there were important non-Moslem minorities, the main body of the nationalist movement continued to profess belief in lay nationalism and emphasized the importance of national unity transcending differences of Moslem and non-Moslem, both in order to forestall foreign claims to "protect" minorities and to secure the active support of the non-Moslems. This lay tendency found expression in the establishment of the league of Arab states in 1944-45. The league was deliberately given a national and not a religious basis, and in the protocol of Alexandria, which first set forth the plan of the league, a special clause was inserted guaranteeing the position of Lebanon, in order to allay the fears of the Lebanese Christians (who numbered about one-half of the population) that the Arab league was only a disguised Moslem league. (See ARAB LEAGUE.) Similarly, in India, a number of Moslems supported the Congress party, which insisted that it was in the fullest sense a nationalist party and not the organ of the Hindu majority.

In social matters, too, the tendency to reject the claims of Islamic law to regulate the whole of social life continued. The movement for the emancipation of women had grown in strength in almost all the Moslem countries. In India, Moslem women were taking a prominent part in public life, in education and social activities. In Turkey, the younger women in the towns had practically achieved equality of status with men. In Egypt, the Red Crescent and other women's organizations were playing a prominent part in awakening the social consciousness. A number of Arab women's conferences were held, notably in Cairo in 1938 and 1944.

On the whole, the majority of the educated classes were becoming increasingly indifferent to the claims of religion and lax in their personal devotions, but in countries like Arabia, which had scarcely been touched by western education, and among the uneducated classes of all countries, religious fervour was still an important factor. Thus while Wahhabism had been shorn of some of its violence and crudity, it still had the allegiance of the greater part of the population of Nejd. The movement initiated by the Mahdi in the Sudan was by no means dead, although it had been dormant since the British occupation. Senussism in North Africa had been stimulated by the promises given to the Senussi by the British government and the freeing of Libya from Italian rule.

The orthodox schools and colleges still continued. The greatest of them, the Azhar university in Cairo, drew students from North Africa and central Africa, from India, the East Indies and China. The pilgrimage to Mecca, though unavoidably restricted during World War II, provided another bond between the Islamic peoples.

Besides these tendencies of long standing, however, it was possible to perceive others of later origin. There was much more doubt in 1946 than there had been even ten years previously of the value of westernization. There was, too, a growing sense of Islamic solidarity, that the Islamic nations should act together both in order to protect themselves from western political and economic aggression and to preserve what was still living and valuable in their own tradition. In certain countries, the movement of secularization and westernization had perhaps passed its peak." After the deposition of Riza Shah in Iran there was a noticeable slackening in the process and even a certain return to the social forms and customs of the past. Even in Turkey, which was always taken as the model of a westernized Moslem state, there were signs that the attitude of the government towards religion had been modified since the death of Kemal Atatürk. Similarly, the movement to free the Persian and Turkish languages of their Arabic words failed.

Among a section of the intelligentsia there was appearing a new intellectual interest in the doctrines and history of Islam. Writers who 20 or 30 years previously ignored Islam were turning back to it. In Egypt, the intellectual centre of Islamic culture, there had been a spate of books by well-known authors about the prophet Mohammed and his religion. The revival of intellectual interests was reflected in the growth of a number of politico-religious movements which were challenging the lay nationalist movements. Thus the Moslem league in India challenged the conception of an Indian nation and sought to replace

it by that of a Moslem nation with a right to independence in those regions of India in which it was predominant. In Egypt, the 1940s saw the rise of the *Ikhwan al-Muslimin*, a popular movement which was strong among the town workers and the younger intellectuals and which sought to rebuild the social and political life of Egypt on the basis of the principles and jurisprudence of Islam.

The soviet government began to show an increasing interest in its millions of Moslem peoples; soviet Moslems made the pilgrimage to Mecca, and diplomatic appointments in the middle east were given to soviet Moslems.

Isle of Man

A British possession in the Irish sea, the Isle of Man has an area of 220.7 sq.mi. Pop. (est. 1939) 50,829. Chief towns: Douglas (20,014), Ramsey (4,240), Peel (2,523), Castletown (1,742). Lieut. governors of the Isle of Man during the decade 1937–46 were as follows: Sir Montagu Butler (Nov. 9, 1933–Sept. 30, 1937); Vice-Admiral W. S. Leveson Gower (Oct. 1, 1937–Sept. 6, 1945); Air Vice-Marshal Sir Geoffrey Bromet (after Sept. 7, 1945).

During the years 1940-45 the annual influx of some 600,000 summer visitors to the island ceased, but the all-the-year-round population was largely increased by the presence of internees, prisoners of war and personnel of the fighting services. In addition to army training units, the island became the wartime home of an important naval radar school, H.M.S. "Valkyrie"; a boys' training establishment, H.M.S. "St. George"; and the royal naval school of music. There were also two R.A.F. airfields, one at Jurby and the other at Andreas, and a number of wireless telegraphy and radar stations in various parts of the island.

During World War II the island contributed more than 6,000 men and women to the fighting services and the merchant navy, and considerable numbers to munition factories. Financially, the Isle of Man government gave to the imperial government £1,250,000 and lent £1,000,000 free of interest. National savings represented about £7,000,000 or £140 per head of the population. Nine thousand additional ac. of agricultural land were under the plow, 5,000 being under wheat which was milled at Laxey in the island. On July 5, 1945, the king and queen presided over the time-honoured Tynwald at St. Jöhn's.

Italian Colonial Empire

Until 1941 the Italian colonial empire consisted of Italian East Africa, Libya and the Dodecanese islands. Italian East Africa (Africa Orientale Italiana) was created on June 1, 1936, after the annexation of Ethiopia and the union of this state in one compact territory with the old colonies of Eritrea and Italian Somaliland. In 1941, the whole of Italian East Africa was conquered by the British who, in May 1941, reinstated Emperor Haile Selassie on the throne of Ethiopia. The rest of the Italian colonial

"Darkest Africa" was not enthusiastic about European culture in 1940, according to Messner of the Rochester Times-Union

empire was at the end of 1946 still under British military administration. The Dodecanese, by agreement of the Big Three foreign ministers, were awarded to Greece.

Libya.—Area: 679,183 sq.mi.; pop. (census June 1, 1940): 910,669 of whom 123,898 were Italians, 6,233 foreigners and assimilated, 31,072 Jews and 749,466 Moslems (mainly Arabs and Berber Arabs but also 31,221 Negroes). Languages: Italian and Arabic. Chief towns: Tripoli (cap., 1940 census 116,387), Bengasi (1939 est. 66,009); Misurata (1939 est. 46,221); Homs (1938 est. 34,940). Governors General: Marshal Italo Balbo (Jan. 1, 1934–June 28, 1940) (killed in an air crash); Marshal Rodolfo Graziani (June 30, 1940–March 24, 1941); General Italo Gariboldi (March 25, 1941–July 19, 1941); General Ettore Bastico (July 20, 1941–Jan. 23, 1943); British administrator, Brigadier M. S. Lush (after Jan. 26, 1943).

Entrea.—Area (1935): 45,754 sq.mi.; pop. (est. Jan. 1, 1940): 688,434 of whom 73,192 were Italians, 242 foreigners and assimilated and 615,000 natives. Among the natives there were 289,358 Christians (Coptic rite), 321,891 Moslems and 3,751 belonging to other religions. Languages: Italian, Amharic, Tigré and Arabic (in the low-lands and ports). Chief towns: Asmara (cap., pop. 1940 est. 91,431); Massawa (1939 est. 17,169). Governors: General Emilio de Bono (Jan. 17, 1935—Oct. 1936); General E. Guzzoni (1936–March 1937); Admiral C. M. de Feo (March 17, 1937—Dec. 1937); Dr. Giuseppe Daodiace (Dec. 15, 1937–April 1, 1941).

Italian Somaliland.—Area (1935): c. 194,000 sq.mi.; pop. (est. Jan. 1, 1940): 1,078,766, of whom 19,068 were Italians, 2,963 foreigners and assimilated and 1,056,735 natives. The natives were classified as follows: Hawiyya 373,344; Darod 241,675; Rahanwen 263,232; others 178,484. Chief town: Mogadiscio (cap., 1940 est. 9,362). Governors: General Rodolfo Graziani (March 6, 1935–1937); Dr. Francesco

The Dodecanese (Aegean Islands).—Total area of some 50 islands and islets: c. 1,035 sq.mi. (of which Rhodes 542 sq.mi.); pop. (est. Dec. 1939): 122,000 of whom 85% were natives (mainly Greeks), 12% Italians and 3% foreigners. Chief towns: Rhodes (cap., 1936 census 27,466); Kalymnos (15,247). Governors: Cesare Maria de Vecchi Conte de Val Cismon (1935–1940); General Ettore Bastico (Dec. 7, 1940–1941); Admiral B. Campione (1941–1943; shot by the fascists).

Stormy Ethiopia.—The annexation of Ethiopia (q.v.) by Italy, as proclaimed by an act of May 9, 1936, continued to have important consequences for Italian foreign policy in the following years. When in July 1936 the League of Nations decided to remove the sanctions, the question of recognition of the annexation arose. After a declaration made by Lord Halifax, a meeting of the council of the League held at Geneva in May 1938 left each government a free hand. This led to two forms of recognition by the several governments: direct recognition by a special act accepting Italian sovereignty in Ethiopia, or indirect recognition given by addressing the credentials of the new ambassadors or ministers in Rome to the Italian sovereign by his new title of emperor of Ethiopia. France recognized Italian sovereignty over Ethiopia by an act of Nov. 13, 1938, and Great Britain on Dec. 16, 1938.

After the Italian occupation of Addis Ababa and the departure of Emperor Haile Selassie, a local government was set up at Gore, in the western part of Ethiopia, which claimed to exercise its authority in the name of the negus. At the same time the remnants of the Ethiopian army of the south, under the command of the son-in-law of the emperor, Ras Dasta Damtou, prolonged the resistance at the entrance to the valley of the Great Lakes. Marshal Rodolfo Graziani, who in Dec. 1986 had succeeded Marshal Pietro Badoglio in the office of viceroy of Ethiopia, carried out against these two main groups of Ethiopian forces some military operations which led to the defeat of Ras Dasta Damtou, who was captured in battle and shot. The operations also brought about the surrender, in March 1937, of the forces of Ras Imru, who had become the head of the government of Gore. He was sent as a prisoner to the island of Ponza in Italy. On Feb. 19, 1937, an attempt was made on the life of Marshal Graziani while he was attending a ceremony. Eight hand grenades were thrown at him and his suite by unknown assailants. Marshal Graziani, who was severely wounded, ordered harsh measures of repression, the practical result of which was to give rise to anti-Italian attempts at rebellion, one in the northern Shoa, headed by Ras Abbeba Aragaui, and the other in the Gojam, with Dejaz Mangasha at its head. These circumstances made it necessary to carry out various military operations in the Shoa and the Gojam, and on Nov. 20, 1937, Marshal Graziani was replaced as viceroy by Prince Amedeo of Savoia, duke of Aosta, nephew of King Victor Emanuel III.

The duke of Aosta introduced a policy of collaboration with the Ethiopian chiefs, calling on them to co-operate in the organization and development of the country, both at the centre and in the outlying districts, and trying to carry out a plan of government inspired by friendly feelings toward the native population, both Christian and Moslem. The Ethiopian church, which had at its head a metropolitan appointed by the Coptic patriarch of Alexandria, had already been proclaimed autocephalic in Nov. 1937, and the Egyptian Metropolitan Cyril had been replaced by an Ethiopian, Abraham, elected by the Ethiopian clergy. Later, when the Metropolitan Abraham died in 1939, and

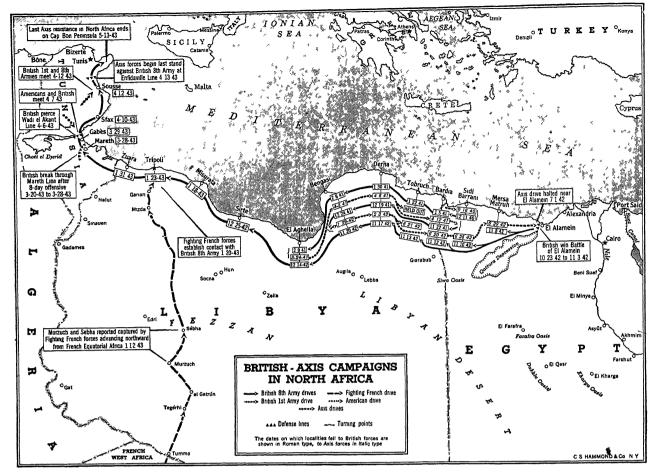

the Metropolitan Johannes was elected in his place, an assembly of the Ethiopian church was held including ecclesiastics and laymen, on the pattern of the majlis milli of the Copts, and a new constitution was adopted for the Ethiopian church. All this was interrupted by the outbreak of World War II, which again brought the problem of Ethiopia into the international field.

The annexation of Ethiopia made it necessary for the Italian government to carry out a plan of public works to confer on that country a modern equipment. The first matter to be dealt with was the problem of communications. For this purpose a road system was studied and completed in the years 1937-1939, designed on lines which overcame the difficulties peculiar to a country crossed by high mountains. In 1936 Ethiopia was connected with the bordering countries only by the French railway from Jibuti to Addis Ababa (486 mi.). Later the Italians built roads which connected it with: (1) Eritrea, crossing the whole of the central and southern plateau of Ethiopia (Assab-Dessye, 298 mi., all tarred; Massawa-Dessye-Addis Ababa, 729 mi., of which 571 mi. were tarred); (2) French Somaliland, a motor road running parallel to the railway line (Addis Ababa-Dawanle, on the French frontier, 420 mi., of which 67 were tarred and 287 on a made bed); (3) British Somaliland, from Harar via Jijiga to Berbera, under the Italo-British agreement of Jan. 1937. Another road connected Addis Ababa with Lekemti in western Ethiopia (201 mi. of which 118 were tarred), while Gondar and the region of Lake Tana were connected with Asmara by a road 213 mi. in length, of which 209 mi. were tarred. To carry out all these works large bodies of Italian workers, both skilled and unskilled, emigrated to Ethiopia, thus permitting an experiment to be made in the employment of European labour in Africa which was not without value.

Development of Libya.-In Libya, the Italian administration pursued steadily the policies which had been started under the arrangements made in Dec. 1934. On Jan. 9, 1939, a royal decree provided that the four provincial commissariats of Libya (Tripoli, Misurata, Bengasi and Derna) should be transformed into provinces which became an integral part of the kingdom of Italy, thus ceasing to be considered a colony. A special form of Italian citizenship was conferred on the natives of Libya, under which they continued to be subject to the Moslem civil law, instead of the Italian civil code. This law came into force in April 1939 and its application was interrupted by the war. In the field of public works the activity of the Libyan government was devoted at this time above all to building along the sea coast the road which joined Tripoli to Bengasi and Tobruk. This road, running for a length of 1,111 mi. and 7.63 yd. wide, was finished in Feb. 1937 and became the main artery of Libya.

The need of agricultural development induced the Italian government to make, in the years 1938 and 1939, two important experiments in population settlement, sending to Libya first 20,000 and then 11,000 agricultural workers. In this way the Italian government intended to settle, if only partially, the problem of over-population in Italy. In the two years mentioned, 3,550 rural families emigrated to Libya, and were settled on an area of 280,987 ac., divided up into holdings, and forming 24 districts. During this same period, and in conformity with a vast plan prepared by the government, the first agricultural settlements assigned to native Libyans were provided. In 1939, 262 farmhouses for natives were built as against 32 in 1938.

The development of the agricultural resources of Libya

was encouraged in the years 1934-39 by the sinking of a series of artesian wells which provided water to irrigate the fields, by rewooding the cliffs, so as to check the advance of the sands toward the cultivated areas, and by introducing modern systems of cultivation. The areas for which grants were made rose in Libya from a total of 463,738 ac. in 1937 to 925,435 in 1940, and those under cultivation from 276,766 ac. to 563,103. In 1940, 201,359 ac. were reserved for olive-groves in which were 2,423,313 olive trees, as compared with 152,868 ac. and a total of 1,806,638 trees in 1937. In the same way the area under vineyards rose from 32,807 ac. with 31,826,825 vines in 1937 to 42,934 ac. with 40,106,500 vines in 1940. Remarkable results were secured in the Jebel of Cyrenaica, where the area under cultivation passed from 14,721 ac. in 1936 to 27,541 in 1938, while the cereal crop rose from 4,843 short tons in 1935-36 to 10,561 in 1937-38.

Eritrea and Somaliland.—In Eritrea, commercial and industrial activities from 1936 to 1940 marked a rapid growth as a result of the greatly increased volume of trade with Ethiopia. Important works were carried out for enlarging the ports of Massawa and Assab, and new roads were built connecting the coast with the interior. Mention should be made in connection with the industrial development of agriculture of the land-reclamation works carried out in the plain of Tessinei by regulating the waters of the river Gash, under an Italo-British agreement signed in 1927. In 1940, a new canal was being built which would enlarge the surface which could be flooded to reach a total of some 17,290 ac. In 1939, 1,100 short tons of dura wheat and 660 short tons of cotton were obtained from the Tessinei plain alone.

In Somaliland, the efforts of the government from 1936 to 1940 were directed to improving the means of communication, the harbour facilities and above all to developing the agricultural possibilities of the country. In 1930, the total length of the roads open to traffic was 8,151 mi.; in 1940 the total stood at 9,032 mi. Great harbour works were carried out at Mogadiscio; in 1939, a breakwater 13 yd. wide had been completed, stretching for more than 0.61 mi. along the sea-shore. The ports had been improved at Merca, which had acquired considerable importance as a result of the growing export of bananas coming from the neighbouring area of Genale, and at Brava. Developments in the field of agriculture had been chiefly those achieved in the cultivation of the banana, in the cotton plantations, in the sugar-cane plantations, and in increasing crops of maize, ground-nuts, and castor-oil plants.

In 1940, there were 179 agricultural undertakings owned by Italians in Somaliland, covering a total area of 160,394 ac., of which 83,004 had already been reclaimed and 45,618 were under cultivation. Important works were carried out along the rivers Juba and Shebeli, where embankments were built, pumping plants set up for raising the water, and irrigation ditches dug for irrigating the land so as to secure higher returns from the native *sciambè* (cultivated fields).

Lost Empire.—At the outbreak of World War II, Italy was actively engaged in the economic development of its colonies. Its entry into the war in June 1940 came just at a time when it was most in need of a long period of peace, and led to the suspension of the work which was already beginning to yield its first important results in the African colonies. The East Africa territories, which were com-

pletely cut off from Italy, held out until Nov. 1941. At first the Italian forces took the offensive in limited areas in the Gallabat and Kassala zones (Sudan) (July 1940) and in the region of Moyale in Kenya (Sept. 1940), mainly for the purpose of gaining time. The operations which led to the occupation of British Somaliland (Aug. 1940) were on a somewhat larger scale.

The British offensive, under General Sir Alan G. Cunningham, announced toward the end of 1940, started almost simultaneously in several directions. The Italian forces, after a long struggle near Keren (Eritrea, March 1940), were soon isolated in the three areas of Amba Alaji (Tigrai), Gimma (western Ethiopia) and Gondar. They capitulated with the honour of arms on May 17, July 8, and Nov. 27, 1941, respectively. In May of that same year the British authorities reinstated the Negus Haile Selassie on the throne of Ethiopia. The viceroy of Ethiopia, the duke of Aosta, was taken prisoner at Amba Alaji in May 1941, and died in captivity on March 3 of the following year, in Nairobi.

In Libya the war was longer and caused heavier losses (see World War II). The final victory of El Alamein (Oct. 23, 1942) led to the occupation of the whole of Libya by the British 8th army under Field Marshal Lord (then Sir Bernard) Montgomery. Tripoli was occupied on Jan. 23, 1943.

Dispositions.—The future of the Italian colonies in Africa was examined at the first meeting of the ministers of foreign affairs in London (Sept. 1945); particular attention was given to a U.S. suggestion to place those territories under the trusteeship of the United Nations. The second

meeting of the "Big Four" in Paris (May 1946), after a French proposal to give to Italy the "single trusteeship" of her colonies under the control of the U.N., decided that the whole problem should be adjourned for one year, Italy renouncing her actual rights, and the administration of those territories to be held during that period by the British military authorities. The conference of the 21 powers in Paris (July-Sept. 1946) approved that decision.

(E. C1.)

As to the Dodecanese, Alcide de Gasperi, then Italian foreign minister, stated in a note sent on Aug. 22, 1945, to the U.S. secretary of state that Italy raised no objections to the passing of these islands to Greece. Turkey expressed the same opinion. The council of foreign ministers of Great Britain, the United States and the U.S.S.R. (London, Sept. 1945) decided that the Dodecanese would pass to Greece At the end of 1946 the islands were under a mixed British-Greek administration.

Italian Literature

During the second half of the 1930s Mussolini reached the apex of his power. He ruled supreme in Italy, after having conquered Ethiopia, founded an empire, undermined the League of Nations, helped establish fascism in Spain and occupied Albania. His prestige in and outside Italy was enormous. Heads of foreign governments, diplomats, bankers, educators, writers and journalists flocked to Rome, the new Mecca, to see him, talk to him and write about the miracles wrought by fascism in the physical and moral life of Italy. In this world-wide chorus of praise, one voice was silent-the voice of Italy's intellectuals. So loud was the chorus, however, that few noticed its absence. In point of fact a survey of the decade 1937-46 in Italian literary life, a decade including the peak years of the fascist era, leads to the astonishing discovery that fascism and its triumphs did not inspire a single work or writer of stature.

Blank Slate.—It is true that fascism was in favour of culture, but it had to be fascist culture. Writers had to show that their works were inspired by the regime and had to exalt its leaders, its achievements, its ideology, the thrill of living dangerously, the joys of large families and the new Italian ever ready to lay down his life for the duce. Historians were expected to demonstrate that Italy had been, under the liberal governments, the Cinderella of the world whereas she was now admired, respected and feared, or, in order to implement Mussolini's fluctuating foreign policy, they were expected to prove that this or that nation was Italy's eternal enemy.

Academic honours and literary prizes were instituted to make the acceptance of this program palatable. But the majority of the Italian intellectuals, spurning both, remained faithful to the republic of letters. Forced to ignore the present, they withdrew into a kind of ivory tower and, like the scholars of the middle ages, dedicated themselves

to learning and to the study of the past. But even the past sometimes proved a mine field. No dangerous parallels could be made with the present. Caesar had to be presented as the hero, Brutus as the villain. Dante's greyhound could be interpreted only as the duce. A sentence such as "England has a great colonial experience" had to be changed into a negative. The dangers multiplied as one approached modern times. The art historian, A. M. Brizio, was turned out of her position because of her favourable treatment of French impressionism; F. Flora, author of a fine history of Italian literature, had to ask someone else to write the last volume dealing with the 20th century; B. Croce's History of Italy symptomatically ended with the year 1915.

Notwithstanding the limitations imposed upon men of letters, the ten years did see the publication of excellent scholarly histories of literature (Flora, P. Pancrazi, G. Prampolini), art (Ed. Unione Tipografico-Editrice Torinese), philosophy (Ed. Fratelli Bocca, G. de Ruggero), music (Andrea Della Corte and Guido Pannain, F. Abbati), the drama (S. d'Amico, M. Apollonio).

Painstaking research on the origins of the Italian theatre brought forth some outstanding works: M. Bonfantini's Sacre rappresentazioni italiane and V. de Bartholomaeis' three-volume Laude drammatiche e rappresentazioni sacre. New studies in universal, European and Italian history were conducted by C. Barbagallo, Croce, Luigi Salvatorelli and Adolfo Omodeo. A thorough re-evaluation of classic and modern authors by such literary critics as Croce, A. Momigliano, Vittorio Cian, Giuseppe Toffanin, Michele Barbi, Luigi Russo, Bruno Nardi, Alfredo Gargiulo and Gaetano Gasperoni brought the past into clearer perspective. There appeared a number of emasculated encyclopaedias in the various fields of knowledge. The publication of the last volume (1937) of the Enciclopedia Italiana was hailed as the last stone completing a monument to fascist culture. However, it was generally recognized that the Enciclopedia, except for the entries dealing with fascism and religion which had either been written or expurgated by the fascist and ecclesiastical authorities, was representative of nothing but the high level reached by Italian culture when fascism came to power.

Especially difficult was the lot of the novelist, who was expected by the regime and his readers, for diametrically opposite reasons, to deal with the contemporary scene. Subjects recognized by all as being taboo included the ugly side of life, poverty, malaise, suicide, as well as complacent or peace-loving characters. Docile or discreet though he might be, no writer could ever gauge with certainty what character, situation, description or line of his novel might arouse the suspicions of the omnipotent and often ignorant censors, who were, as a rule, retired army colonels or former members of the diplomatic service.

Given these circumstances, novelists also sought refuge in the past. They found it in their own adolescence or in the delineation of city and provincial life of the Ottocento (A. Palazzeschi, Riccardo Bacchelli, O. Vergani, Bino Samminiatelli, Bonaventura Tecchi, Giovanni Titta Rosa, Alba de Cèspedes, Vito Mosca, Vasco Pratolini, etc.). Some successfully shifted their early experiences against fantastic and mythical backgrounds (C. Alvaro, B. Cicognani). Others poured out their stories in diary form without revealing anything worth while. In a deliberate effort to elude censorship, Alberto Moravia and Alvaro transferred the action of their novels (La Mascherata and L'Uomo è forte) to an imaginary police-state. Although the subter-

fuge worked in Alvaro's case, Moravia's work was banned shortly after publication.

Other manifestations of escapism were "la bella pagina," brief essays or bravura descriptions couched in a hybrid form between prose and poetry, but excelling in lyrical quality and elegance of style.

The two most significant novels produced after fascism's advent to power were by two young writers who were approximately 14 years of age at the time of the march on Rome: Gli indifferenti (1929) by Alberto Moravia and Conversazione in Sicilia by Elio Vittorini. The first, which escaped the censor's eye by a mere fluke, dealt with the complete amorality and utter degeneration of the Italian bourgeoisie; the second, published in a magazine a few months after the proclamation of the empire and soon suppressed when it appeared in book form, described the disillusionment and revulsion of the people for the life they were compelled to lead, their hatred of the things they were forced to do, their compassion for the "suffering world," and their yearning for "new duties" in a new humanity.

Moravia's "indifferentismo" and Vittorini's activism were clearly manifestations of the spiritual evolution of the young generation and its gradual but definite detachment from the fascist ideology.

The theatre was the literary field most completely devastated by the dictatorship. It was said that Mussolini had set up a special censorship bureau for the theatre under his personal supervision, in the conviction that an actor could, by the modulation of his voice and the expression of face or hands, suddenly inject political significance into an otherwise innocuous line which, communicated to a crowd in the semi-obscurity of a hall, might readily provoke a political demonstration. Be this as it may, the fact remained that no play of real merit was produced in Italy during the reign of fascism.

The most discussed literary movement of the decade 1937-46 was "ermetismo" or "hermetic" poetry. Its roots could be found near and far. Its meaning was for the most part obscure: the poet limited himself to distilling from his soul the lyrical emotions registered by his mind during a particular event, a personal experience, a vision or a dream, about which the reader knows nothing, but which he is supposed to grasp through the suggestive impression arising out of the rarefied musical waves produced by the word. The poets more or less associated with "ermetismo"-G. Ungaretti, E. Montale, Salvatore Quasimodo, Alfonso Gatto, Mario Luzi, Piero Bigongiari and Alessandro Parronchi-reached the heights of their popularity during the last years of the dictatorship, following a bitter campaign on the part of the fascist press that recognized in their obscurity a hiding-place for their antagonism against the regime.

A panoramic view of Italian literature up to the fall of fascism thus reveals on the one hand a large output of printed matter by fascist scribes and party hacks without culture or following, and, on the other, quite a few imposing works in the field of historiography and literary criticism which kept alive the spirit of freedom and independence. There was in the creative field a tendency toward surrealism and fragmentarism, a distinct emphasis on plot, psychological analysis and the sensational rather than on the beautiful. There was general agreement that the two most conspicuous currents—"indifferentismo" and "ermetismo"—which proved to be the only shelter and salvation of many writers, were both symptoms of the profound moral, intellectual and political crisis which was being undergone at that time in Italy.

Risorgimento.-Freed from the shackles of fascism after a terrible war, Italy worked feverishly to rebuild not only her devastated cities and her ruined economy, but her culture. There was an unquenchable thirst to know what had been written and thought abroad during the 20-year blackout of fascism. Only in 1945 were Italians allowed to read Erich M. Remarque's All Quiet on the Western Front, and the works of Ignazio Silone, Emilio Lussu, Giuseppe Borgese, Gaetano Salvemini, Carlo Sforza, Don Luigi Sturzo and other Italian exiles. U.S., British and U.S.S.R. books were widely read and studied. Noteworthy in this connection were two histories of soviet literature, one by Ettore Lo Gatto and the other by R. Poggioli, Somma's history of U.S. literature, Maria Martone and Bizzarri's anthology of Anglo-U.S. writers, Vittorini's Americana and the yearly international Quaderni of Prosa edited by G. Manzini and Poesia by E. Falqui.

Regained freedom of thought and expression gave a tremendous impetus to artistic and literary life. The first tidal wave of publications could not but be largely autobiographical in nature. Many authors poured out everything they had thought, known and felt but could not express about fascism when it was in power (Flora, B. Allason, Palazzeschi, Barbagallo, F. Monicelli, L. Mondini, A. Favoino, V. Napolitano, etc.); some (G. Persico and the scientist M. Giua) told of their experiences as political prisoners; others (L. Bolis, Ascarelli, A. M. Santacroce) dealt with nazi-fascist atrocities; another group (S. Aleramo, Tecchi and A. Troisio) described civilian life during World War II. Partisan warfare and the resistance movement, in which such promising young intellectuals as E. Colorni, G. Pintor, Leone Ginzburg and the painter Agostoni Ciri lost their lives, provided a rich source of material (Pino Levi, Giorgis Bocca, R. Battaglia, G. Beltrami, A. Benedetti, J. Lussu, etc.), and inspired two special issues of the new monthly Mercurio. Statesmen, generals, diplomats and journalists (Benito Mussolini, Galeazzo Ciano, Pietro Badoglio, G. Carbone, M. Roatta, E. Grazzi, P. Monelli, etc.) published memoirs, reports and secret documents on the political and military events which preceded and followed the war and which, evaluated cum grano salis, would prove invaluable to the student of World War II.

In the field of fiction two names stood high: that of Vittorini for his powerful novel Uomini e No on the occupation and resistance movement in Milan in which the people fighting in the streets become the symbol of humanity fighting oppression; and that of C. Levi, a surgeon, painter and political prisoner who, in Cristo si è fermato a Eboli, gave a stirring picture of life among the hapless primitive peasants of Lucania.

To these names should be added those of Natalia Ginzburg, S. Micheli, A. Villa, C. Coccioli, B. Joppolo and Guido Piovene who, in their novels, cut deep into the problems of the times, revealing the anguish of man living in a world which might die, in the expectation of a world not yet born.

Philosophical studies after the fall of fascism showed three different trends: neo-hegelian idealism, Christian spiritualism and independent realism. Existentialism, although widely discussed, so far had no perceptible influence on literature. "Hermetic" poetry showed a marked tendency toward clarity of form and content. Writers, in their vast majority, emerged from their ivory towers to take active part in the life of the nation. Their evolution was evident not so much in books, which were slow as vehicles for the discussion of the pressing problems of the moment, but in the galaxy of lively new periodicals which served as easily accessible forums: Realtà politica (Actionist); Città Libera (Conservative); La Nuova Europa. (Ed., Salvatorelli); Belfagor (Ed., L. Russo); Rassegna italiana (Ed., F. Flora); Europa Socialista (Ed., Silone); Politecnico (Ed., E. Vittorini); Ponte (Ed., P. Calamandrei); Risorgimento (Marxist); Società (Marxist); Inventario (Ed., Berti and Poggioli); Mercurio (Ed., De Cespedes). The trend toward extremism so evident in 1944 had been replaced in 1946 by a growing consensus among writers that Italy's best chances lay in a socialist democracy with the artist participating fully in the solution of the country's social and political problems, history having amply proved that the loss of civil rights affects every citizen, the artist included.

Italian Possessions in Africa

See Italian Colonial Empire.

760 . Italy

A republic in Europe, Italy had a pre-World War II area of 119,733 sq.mi.; pop. (census of 1936) 42,993,602 (est. July 1, 1943) 45,681,000. Chief cities (census of 1936): Rome (capital) 1,150,589; Milan 1,115,848; Naples 865,913; Genoa 634,646; Turin 629,115. Religion of the state, Roman Catholic. Victor Emmanuel III was king July 29, 1900, until his abdication May 9, 1946; Humbert II, king, May 9-June 2, 1946.

Forging the Axis.—At the beginning of 1937, although the first step toward an agreement with Germany had been completed by the visit of Count Galeazzo Ciano to Berchtesgaden in Oct. 1936, the political program of Benito Mussolini appeared uncertain and wavered between two

opposing tendencies.

The chief manifestation of a tendency toward conciliation, apparent but deceptive, was the "gentlemen's agreement" of Jan. 2, 1937, whereby Mussolini seemed to want to reassure England about his intentions in Africa and in the Mediterranean. So it seemed, and yet in the same month Hermann Goering was received in Rome and on that occasion it was publicly reiterated that the two nations had the same ideals and consequently the same adversaries.

Returning thereafter to a policy of reassurance, in keeping with the highly Mussolinian style of alternating threats of war with promises of peace, Italy concluded, in the following March, a pact of friendship with Yugoslavia, and the duce delivered a speech at Tripoli in which he declared that Italy intended to be left alone in its program for the development of East Africa, a task which would occupy it for many years. This was a confirmation of the "soothing" declarations made in 1936 to a correspondent of the Daily Telegraph immediately after the close of the Ethiopian campaign.

But whether Mussolini was temperamentally incapable of a foreign policy of prudence, or whether the developments of the Civil War in Spain convinced him that a serious attempt at conciliation was not necessary, the fact remained that in the course of 1937 the adherence of fascism to the policies of Germany took shape ever more clearly, and the foundations of all the future conflicts were laid.

The Italian people, wearied by the efforts they had put forth in Ethiopia and in Spain, did not fail to see the megalomania of these new schemes, and indubitable signs of discontent appeared in Italy. In order to counteract this reluctance to become involved in new adventures, and above all to become associated with the fate of Germany and of its leader, the dictator stressed the theme of living space which he had already invoked during the Abyssinian undertaking. This argument was indeed confirmed by the growing distress resulting from overpopulation (for which emigration no longer provided an outlet) and by a conspicuous decline in foreign trade and in the flow of tourists; and yet nothing could dispel the impression that even these phenomena were not merely the result of economic factors, inasmuch as the policies of the fascist regime, openly imperialistic and intransigent, were responsible for the diffidence and hostility of foreign countries.

Although it was easy to perceive this state of mind both within Italy and abroad, Mussolini decided to abandon all hesitation and speeded up the advance toward alliance with Adolf Hitler.

On Nov. 6, 1937, came the adherence to the anti-Comintern pact, on Dec. 10 the announcement of the with-

drawal of Italy from the League of Nations and finally on Dec. 14 Count Ciano delivered a noisy harangue in the chamber of deputies in which he reaffirmed the "natural aspirations of Italy" for Jibuti (French Somaliland), Suez (Egypt) and Tunis (Tunisia). Although it was well known that the territorial question was raised with reference only to the French port of Jibuti, terminus of the Addis Ababa railway, a challenge was sensed in the Montecitorio speech which aroused alarm in Europe. A few days later, on Dec. 17, the Italian government renounced the Mussolini-Laval agreement of 1935, under the pretext that France had defaulted in its obligations by adhering to the policy of sanctions.

In the beginning of 1938 Europe was clearly divided into two camps. In May Hitler went to Rome. The meeting of the two heads of government signified that henceforth they were following a personal, or a party, diplomacy.

It was on the occasion of the latter visit that the pope left Rome for his villa at Castelgandolfo, deploring that the eternal city had given asylum to "a cross which was not the cross of Christ." Emboldened by the success he had achieved, Hitler meanwhile was taking the first steps toward the realization of his program of world hegemony.

The first submission of Mussolini to the will of naziism was his consent to the annexation of Austria, which he had so vigorously opposed a few years earlier. The duce was unable to find any justification for this other than to recall how he had been isolated at the time of his first intervention and to conclude sorrowfully that, after all, it was best not to oppose the inevitable.

Mussolini apparently decided, however, that his partner was taking the initiative a bit rashly in dangerous affairs, and he proceeded to re-examine the problem of relations with England, perhaps in order to demonstrate his own independence. On April 16, 1938, in London, a new agreement was signed, in the spirit of the gentlemen's agreement; by this accord Italy recognized the rights of England to the waters of the Blue Nile and reaffirmed the obligation to maintain the status quo in the Mediterranean, thus renouncing any territorial aspirations toward Spain.

Meanwhile, in Germany, agitation over the Sudeten question was beginning. In the face of the danger of a general conflagration, Neville Chamberlain requested the intervention of Mussolini which brought about the Munich meeting in September. At that time the fascist leaders paid no attention to the true attitude of the Italian people, nor did they take note of the relief which greeted the disappearance of the spectre of war, of a war accepted in order to further the ambitions of Hitler. On the contrary, Mussolini was intoxicated by his success, by the great praise which arrived from every part of the world, and he perhaps had the impression that he had taken over the leadership of political events, if not of all Europe, at least of the totalitarian countries.

However, once the euphoria of the first moments had vanished, it was immediately evident that Munich signified merely a momentary pause on the way toward a conflict that seemed inevitable.

Under the pressure of events, the aligning of forces proceeded thereafter automatically, with this difference only, that whereas in Germany the people followed their leader with enthusiasm, the Italian public disagreed more and more with the directives of the fascist government.

The expedition into Albania in April 1939 failed to arouse any new enthusiasm in Italy; abroad it stirred up grave anxiety and opposition.

"Pact of Steel."—Hitler and Mussolini, close allies from then on, concluded, in May 1939, a military alliance which was called the "pact of steel."

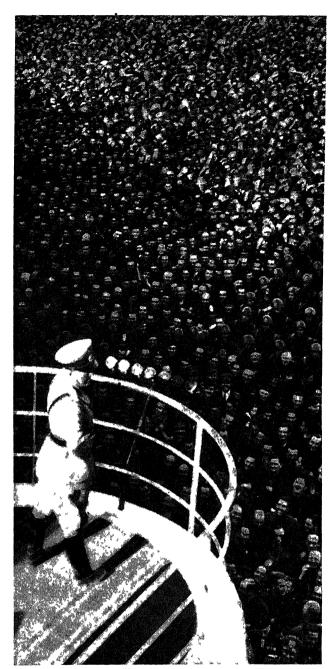

As was revealed later, the duce had requested that, in whatever way war might come, it should not take place earlier than 1942. This reservation was dictated not so much by domestic political considerations as by the knowledge that the armed forces of Italy were absolutely unprepared to embark with inadequate means upon a worldwide conflict. There were some who believed that, behind the theatrical gesture of signing the "pact of steel," Mussolini concealed a desire to postpone the time when the fascist regime should be submitted to the test of a war. He should have known his own strength; and yet, on the other hand, many antifascists held that the lies in the fascist press, the apparent splendour of the military parades and reviews, both air and naval, and the boastful pronouncements of the leader and all his satellites had finally made Mussolini a victim of his own propaganda, that he had, as it were, been blinded by it.

The Italian general staff, which had always, even during the Ethiopian campaign, remained conspicuously apart from the fascist party, was then obliged to enter relations with the German high command. Within the army, these first contacts aroused a wave of aversion rather than of comradeship toward the new allies.

Although public manifestations of disapproval were not possible, discontent was widespread and criticism, wary but insistent, crept into all sectors. It was said that Italy was weary; that the potentialities of East Africa rendered useless any attempts toward further expansion; that the Germans would soon change from allies to masters. Some of the conscripted classes had been under arms since 1933 and had already been through the Ethiopian and the Spanish wars; furthermore there was talk of serious deficiencies in the military potential, the resources of which had been exhausted by two undertakings which should have been of secondary importance for a nation which pretended to be a great military power.

Junior Partner.—When, having concluded his frenzied political activity, Hitler took the initiative in military operations, many throughout the world marveled that Mussolini did not immediately draw his sword by the side of his ally. But this was not surprising to those who knew the situation, least of all to the Germans who had numerous observers in Italy and who were very well informed about the material and psychological condition of the country. Thus, there came about the unexpected announcement of Hitler, at the moment when he set fire to Europe, that he had no need of military assistance from his allies. World War II came three years sooner than the time which had been forecast for the inevitable recourse to violence, in spite of a last minute intervention of Mussolini, who was under the illusion that he might bring about another Munich.

For the second time in history, Germany had confronted Italy with the fait accompli of a war of incalculable consequences, undertaken without its consent. From a juridical point of view there was justification for defaulting the agreements entered into and pursuing an independent policy. But the inertia of Italy after German military operations opened was a serious blow to the prestige of Mussolini, both at home and abroad. In world public opinion there sprang up accusations of bad faith toward alliances; in Italy among the fascists themselves a feeling of moral degeneration began to spread since they did not understand why Italy had failed to intervene after so many thunderous pronouncements. The lightning bolts which, according to Mussolini's wishful thinking, were held aloft by great effort in his hands, now fell to earth at the very

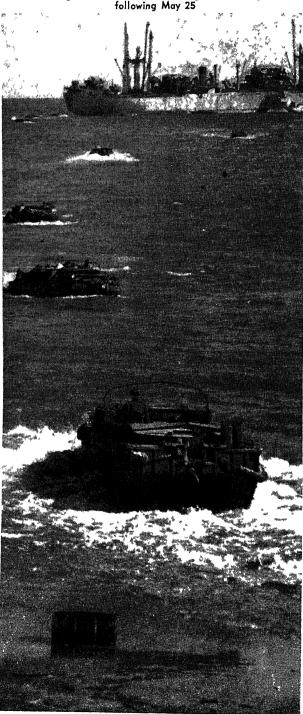

Mussolini striking a martial pose at Treviso on Sept. 21, 1938 as he promised crowds below that Italy would stand beside Germany in any future war

moment when the people were expecting to see them flash. Italy was thus a "nonbelligerent," an expression which meant that its position was not that of a purely neutral state. It is not clear what were the feelings of Mussolini during the first months of World War II. Certainly he was humiliated by the spectacle of the German military power and by the diplomatic successes of the reich. Henceforth, there was no doubt about a reality which he had attempted, probably for reasons of prestige and vanity, to shut his eyes to: the reality of the inevitable dependence of the Italian general staff and of Italian diplomacy upon nazi initiative whenever fascism should decide to enter the struggle. According to an interpretation in his favour, Mussolini was hoping that Hitler would find himself in serious difficulties and that the intervention of Italy, dip-

lomatic or military, would reserve for it a preponderant role in the final decision.

On the contrary, events proceeded at a headlong pace. After the battles of France, the Netherlands and Belgium, after Dunkirk and the lightning advance of the German armoured divisions toward Paris, it seemed to Mussolini that World War II was approaching an end. Without consulting anyone, he wrote to Hitler that he was ready to

Transporting cargo by amphibious trucks from supply ship to the Anzio beachhead in Italy. Allied troops landed at Anzio on Jan. 22, 1944, and fought there until a breathtrough was accomplished the

declare war on England. The German campaign in Norway had convinced him that in modern warfare fleets no longer had their former importance and that the German air force could be the decisive element in the war.

When the leaders of the armed forces, as soon as they were informed of his plans, attempted to restrain him by recalling the very serious deficiencies in military organization and the dangers which would result to the colonies with the merchant marine dispersed on all the seas of the world, Mussolini's reply was that he was the only judge in political affairs and that he needed a few thousand dead in order to have a seat at the peace table: "In September," he said, "all will be over."

Disastrous Decision.—On June 10 came the declaration of war. From the balcony in the Piazza Venezia he appealed once more to the argument which was considered effective in spurring the Italian people along the road followed by fascism: "This is the struggle of the peoples who are poor and eager to work against the greedy who hold a ruthless monopoly of all the wealth and gold of the earth."

Following the manifestation organized by the party, the crowd broke up in silence since all understood the seriousness of the step which had been taken. Furthermore, the Italians felt in their hearts a sense of humiliation and disgust at this declaration of war upon a France which was already mortally wounded.

Mussolini in the meantime had obtained from the king the appointment as commander of the armed forces.

Operations on the western front lasted only a very few days. The Italian war was to be fought more onerously in the Mediterranean and in Africa, where it was immediately evident that the unexpected English resistance to the attack of Hitler would tax all the resources of Italy.

The deed of June 10 which, according to the dictator's propaganda, was to be a mere prelude to the peace conference, placed Italy in the midst of a war whose end could not be foreseen. While East Africa remained completely cut off from all communication with the metropolis, the troops sent into Libya won an initial victory over the English on the Egyptian frontier. For those who believed in the power of Mussolini, this was the beginning of a series of brilliant operations on African soil. But the prolonged inactivity of Gen. Rodolfo Graziani, following the first advances, began to arouse a suspicion, even among the least-informed masses, and then a conviction, that the leaders who were responsible for World War II had done nothing to make adequate preparations. Soon the very serious disasters in Cyrenaica strengthened this feeling of opposition and hostility toward the war, sentiments which already were alive among the Italian people for idealistic, historical and traditional reasons; and this hampered the military efforts of the fascist government. The shamefaced propaganda which aimed to arouse in the Italians a feeling of hatred for peoples whom they had always considered as friends had no effect; neither did the harsh penalties threatening anyone who declared his sympathy with the democracies nor the attempts to win the Italians over to the German program for a new European order. On the contrary, both among the civilians and within the ranks of the armed forces there began to take shape that state of mind which was to give birth to the final catastrophe.

On the other hand—and this was the tragedy of Italy—military defeat symbolized for the Italians the end of fascism; they saw with dismay that although their country deserved to be spared the sufferings of defeat, an axis victory would mean the definitive triumph of fascism.

The struggle between the general staff and the fascist party, that is, between all the military commands and the

government of Mussolini, grew bitter very soon and provoked the withdrawal of Marshal Pietro Badoglio after the opening of the campaign in Greece (an expedition which Mussolini and Ciano had ordered without taking into account the conditions which the military had deemed essential for intervention in the Balkans). The retreat of the marshal was a serious blow for the fascist regime since the public considered the victor of the Ethiopian war as a representative of the Italian military tradition, one who was independent of particular political doctrines and motivated only by the welfare of his country. Now they understood that the command of military operations was passing irretrievably into the hands of the party, which remained alone to fight its war and to sacrifice the youth of Italy by sending them into Africa and Greece with inadequate arms.

Request for Help.—In order to remedy the failures in Africa, Mussolini had asked Hitler for a share of the armoured cars captured in France. The fuehrer replied that he offered not only equipment but two whole armoured divisions. Mussolini's first query was, as the story goes, "How will we liberate ourselves from them?" But his doubts were dispelled in the face of the consternation in Italy and the isolation in which, as he realized, the party had fallen. The spectacle of the German divisions, coming from the north to embark from Naples and Sicily, would be useful, he thought, for domestic purposes.

And so the troops from the reich arrived, and not all of them embarked on the ships heading for Libya. In the north, at Naples and in Sicily, German air bases and commands, depots and departments were installed as though the Germans were on their own property.

It was a repetition of the fatal misfortune of Italian history—the coming of aid, as had happened from time to time, to the conflicting parties from foreign armies. Those officers and soldiers who still had the will to fight could not escape a feeling of distress at the humiliation of having what was for all practical purposes a superior German command placed over the one body of Italian troops which was fighting.

Since the beginning of 1941 Mussolini had felt obliged to make excuses; in one of his speeches he declared that "sometimes history takes one by the throat," thus revealing that he would have liked to postpone the final military effort until 1942.

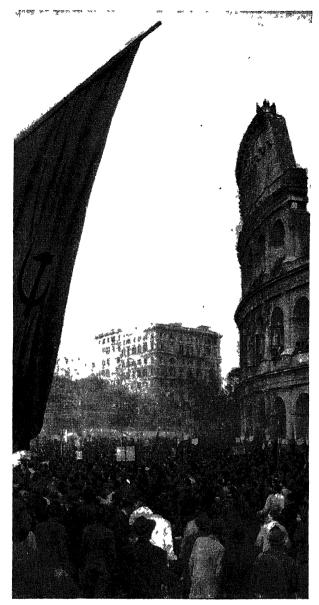

In Nov. 1941 came the declaration of war on the U.S.S.R., and the dispatch of several divisions to the Don river, a decision of Mussolini's, who perhaps intended by that means to repay his debts toward his ally. (See WORLD WAR II.)

The Italian soldiers fought without enthusiasm but courageously in Russia and throughout the changing vicis-situdes of the struggle in Africa.

There were notable examples of valour both on the sea and in the sky, where the pilots tried by courage and skill to compensate for their defective equipment. But these were individual efforts, performed in a spirit of competition or for military glory, not because of any faith in ultimate victory.

The futility of so many sacrifices, at such great cost, had for some time provoked in Italy a bitter resentment toward Mussolini, and popular reaction would not have waited for the Anglo-U.S. invasion of Sicily had it not been intimidated by the presence of German troops allied to fascism.

For at that time the ancient political parties were secretly attempting to regroup their followers around the leading exponents of antifascism in order to be ready to assume

Protest demonstration by Romans bearing communist banners before the Colosseum on March 6, 1945, after the escape of Gen. Mario Roatta, imprisoned as a war criminal. A riot ensued at the Quirinale in which demonstrators clashed with armed carabinieri

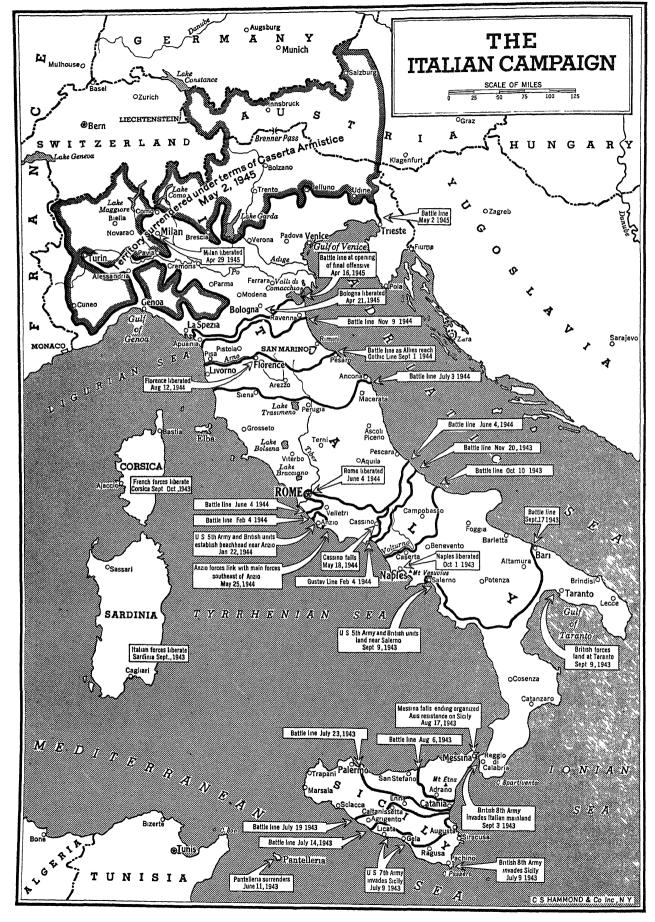

their responsibilities whenever the collapse of the regime should permit the reorganization of Italy on a democratic basis

Mussolini understood that the moment was decisive and sought an interview with Hitler, to whom he wanted to explain the conditions which were forcing Italy to withdraw from World War II. The meeting took place at Feltre, July 19, 1943; it brought no result whatsoever, since the duce lacked the courage to mention a separate peace.

The Italians understood that it was necessary, for better or worse, to come to a decision.

Among the various groups which were striving to seize the initiative in the reaction against the fascist system, success fell to the military group under Marshal Badoglio, who had maintained contacts with the antifascists since 1942.

Duce's Downfall.—After the Anglo-U.S. invasion of Sicily, it looked as if the German position were sufficiently shaken to permit an attempt toward liberation from the fascist

regime and from its foreign supporters. The heads of the party also understood that there was no time to lose in view of the rapid turn of events; during the night of July 24–25, 1943, the grand council placed the duce in a subordinate position by summoning the king to make the decisions which were demanded by that grave hour.

The following day the king invited Mussolini to resign. As he emerged from the Villa Savoia he was arrested by carabinieri.

The task of forming a new government was entrusted to Marshal Badoglio. Meanwhile, a crowd was attacking the headquarters of the fascist party, demonstrating tumultuously through the streets of the capital until late at night.

The situation of Italy was tragic. Its military strength was represented on home soil by a few poorly armed divisions, while the greater part of the troops were scattered in Libya, France, Croatia, Albania and Greece.

The Germans, on the other hand, had eight divisions in Italy, of which four were armoured; all were equipped with abundant supplies. Italian air power remained with only 400 aeroplanes as against twice that many German units. After July 26 numerous other nazi forces began to descend into Italy through all the Alpine passes. The Allies had not yet opened the attack on the peninsula.

In spite of the official declaration whereby the new government declared its intention of continuing World War II, no one doubted that the fall of fascism must symbolize, sooner or later, the separation from Germany.

At this time there arose differences of opinion between the antifascist political leaders and the military advisers of the king. The political leaders wished to break with Germany immediately; they counted on the psychological factor of insurrection, which would in their opinion induce the Allies to bring aid at once. The military was afraid of Germany and feared that the Allies were not prepared to invade Italy.

Double Occupation.—How were the Italians to free themselves from the Germans who were occupying their country with overwhelming forces? Whatever happened, the national soil was destined to be transformed into a battlefield and to suffer systematic destruction by both opponents in accordance with the inexorable laws of war. And, indeed, all the way from Sicily and the southernmost tip of Italy to the Alpine circle, comparatively little ground was to be spared.

After Marshal Badoglio had made arrangements for direct contacts with the Allied command, an Italian general was sent to Lisbon, Portugal, where a first meeting was held. On Sept. 8, 1943, the armistice was agreed upon, following negotiations which were too long and permitted the Germans to bring down reinforcements.

The king and Marshal Badoglio decided in the meantime to remove the seat of government to the south, and they succeeded in reaching Brindisi. As a political move, the abandoning of the capital dealt a serious blow to the prestige of the monarchy since the people desired a defense at whatever cost as a gesture of heroism and steadfastness; however, whether defense would have been possible and whether the Allies were really in a position to make a decisive intervention was not known.

From the new provisional capital, Badoglio hoped, relations between the Italian government and the Allied command would be strengthened; the latter declared that the armistice remained in full force but that the conduct of Italy might lead to mitigation of its provisions.

The Italian command thought that the greatest possible effective contribution toward World War II was desired, and—although this was not a condition of the armistice—

war was immediately declared on Germany. This act resulted in recognition of cobelligerency by the Allies.

The fleet had loyally carried out the terms agreed upon and had collected important forces in Malta and other ports. These were immediately engaged in military action or in escort duty, thus permitting the transfer of a large Allied fleet to other waters. During these operations the Italian navy suffered notable losses in men and matériel.

The troops in France, Croatia, Montenegro and Greece received orders to join the partisans. The contingents in Sardinia and Corsica drove out the Germans there. In the north began the widespread resistance movement which was to have an impressive development and to constitute an effective contribution to the Allied victory in Italy.

An Italian motorized force of 5,200 men (later expanded to 21,000) immediately joined the U.S. 5th army.

As for the air force, Winston Churchill proposed to furnish better equipment to the courageous pilots of Italy. All this recognition spurred on the desire, already lively, to contribute to the war against the Germans in an ever-increasing degree.

However, in spite of excellent evidence of military collaboration, the Allied command did not encourage further Italian participation in World War II. Thinking that this refusal resulted from the difficulty Italy had in furnishing war equipment, the Badoglio government offered several divisions and a few special forces which were reorganized and equipped exclusively with Italian supplies. Still the answers were negative. A large part of the Italian arms was sent into the Balkans.

Nor was adequate use made of the prisoners who were in Allied hands (more than 1,000,000, counting the civilians of East Africa) although many of them requested enlist-

"Good Riddance" was the reaction of Werner in the Chicago Sun to the Italian plebiscite held in June 1946, which resulted in a 5–4 decision against retaining the monarchy

First session of the Italian Constituent assembly which opened at Rome on June 25, 1946. Premier Alcide de Gasperi, head of the provisional government, is shown addressing the assembly

ment. The only forces welcomed by the Allies were the numerous soldiers employed in service behind the lines and in coastal and anti-aircraft defense, as well as more than 1,000,000 soldiers and prisoners employed as labourers. One of the plausible explanations of this negative attitude was undoubtedly the fact that the Allies hoped they could swiftly, with their own armies, overcome German resistance in Italy.

Under the double occupation (Allied and German) the amount of money in circulation multiplied at a dizzying rate, as a result of the simultaneous issuing of currency by both groups of belligerents. While in the south large imports of am-lire (Allied occupation lire) were put into circulation, in the north the Germans and the fascist government were printing money at an ever-increasing rate in order that higher wages might attract northward the great mass of Italians who had preferred to remain in the south so as not to collaborate with the Germans. The devaluation of money, the upward spiral of prices, corruption and the black market became phenomena associated with the war and the postwar period.

Thus, the new Italy took its first steps with some difficulty: the Italian government was weak since its powers were limited by the armistice and since it was hampered by interferences of the Allied Military government (A.M.G.); communications were lacking and confusion was general.

In Dec. 1943 the Badoglio government had moved from Brindisi to the city of Salerno. The aged members of parliament and the professional men who composed it won the complete confidence of the Allies and little by little they brought about the restitution of liberated territory to the Italian administration.

In the meantime, President Roosevelt had been urging

the formation of a democratic government in which all the antifascist parties should collaborate. Representatives of these parties assembled in Bari in Jan. 1944 and unanimously demanded the abdication of the king. After laborious negotiations, the king accepted the solution of abdicating in favour of Prince Humbert as soon as the capital was occupied.

Immediately after taking office, Prince Humbert received the resignations of the cabinet and entrusted the task of forming a new government to Marshal Badoglio. The heads of the various parties declared, however, that they did not consider it fitting to retain a military man who did not belong to any political party as head of the government; thus, they brought about the formation of the first cabinet of Ivanoe Bonomi which moved to Rome in early July (the capital had been taken by Allied troops on June 4).

Political Legacies of the War.—After V-E day and the liberation of the north, when it became desirable to have representatives of all the provinces participate in the government, the new coalition government of Ferruccio Parri was formed (June 1945). Professor Parri had always been a fervent antifascist and had played a dangerous and active role as a leader of the partisans in northern Italy during the period of clandestine resistance.

By Sept. 1945 the various parties had nominated representatives, called *consultori* (counsellors), who took their seats in the chamber of deputies with the task of preparing the way for political elections to nominate representatives to the constituent assembly. In Dec. 1945 a crisis provoked by the Liberal party led to the formation of the new coalition government headed by the Christian Democrat leader, Alcide de Gasperi.

On all sides there were pressing tasks of reconstruction; and against the absorbing background of the peace conference other serious problems relating to the constitution and governmental institutions appeared menacingly.

But in spite of the grave state of affairs at that time, the popular will had an opportunity to manifest itself on June 2, 1946, in a manner so decisive that it surprised all those who believed that the Italian people were not prepared to exercise the privileges of democracy. The referendum decided in favour of a republic; at the same time the chamber of deputies to the constituent assembly was born, in which the Christian Democrat party won the majority of places, with the Socialists and Communists also heavily represented.

This election brought about the formation of a new tripartite government supported by the mass parties and again headed by De Gasperi.

In the meantime, the conferences of London, Paris and New York were preparing the peace treaty. Already in Sept. 1945, a small delegation, presided over by De Gasperi, then minister of foreign affairs, had been invited to London to present to the four foreign ministers the point of view of Italy on certain problems relating to the peace treaty, particularly on the question of Venezia Giulia, which was the most serious and delicate of the whole treaty. While recognizing the obligations inherited from the fascist period, Italy also disassociated the responsibility of the Italian people from that of Mussolini; it declared itself willing to renounce the eastern frontier which had been assigned to it by the treaty of Rapallo and requested that the new frontier be drawn along the line proposed by Pres. Woodrow Wilson in 1919.

The Italian suggestion was largely accepted since it was decided at London to adopt the ethnic principle as the criterion for drawing the new frontier and to send an appointed commission, in case of need, to the area for the necessary information. After eight months of toil the commission presented the foreign ministers with the findings of the investigation. The result was that there were four ethnic lines (the U.S., the English, the French and the soviet.)

In the second half of June 1946 the thread of a laborious compromise among these four lines was woven, with Italy remaining powerless to intervene in any way. When the conference of the Big Four closed, the public was surprised by the presentation of a new plan which departed entirely from the ethnic criterion agreed upon at London.

Thus was born the new formula for the internationalization of the territory of Trieste, with the . transfer to Yugoslavia of cities of the western coast of Istria which were recognized as Italian (Pola, Parenzo, Rovigno). The Paris conference also determined the rectification of frontiers in favour of France (against which Italy had objected in vain), fixed the amount of reparations and settled the questions of the fleet, the armed forces and the colonies in

a manner contrary to Italian hopes.

At the conference of 21 nations which convened in Paris shortly afterward, the major decisions agreed upon by the Big Four did not undergo substantial modifications, nor was there any opportunity for Italy to negotiate. The good will of a few individual statesmen of the United Nations was not able thereafter to attenuate the punitive character of the treaty. Italy: Statistical Data

lwo Jima

The battle for Iwo Jima in 1945 was the bitterest in 170 years of illustrious U.S. marine corps history. The conquest of that heavily defended island represented the empirical test of the amphibious assault technique which otherwise had been so successful throughout World War II.

Iwo Jima offered no opportunity for surprise, little opportunity for manoeuvre. Its capture was a task for specialists.

It clearly demonstrated the narrow margin which divides success from failure.

That the marines were successful at Iwo Jima was manifest, that the techniques they employed were sound could not be questioned. While the marines' devotion to the amphibious specialty had its beginning in the early days of the U.S. war for independence, a strong resurgence followed World War I.

During that period, while most of the world's armed forces were engaged in study of the first world war—thinking mainly in terms of trench warfare and great continental wars of position—the U.S. marines applied themselves, with singular faithfulness, to the manifest problem of assaulting a fortified beach.

Iwo Jima, considered by the Japanese as the main island

Advancing under murderous Japanese fire, U.S. marines of the fifth division took this ridge on the beach of Iwo Jima near Mt. Suribachi (left background) during the invasion of Feb. 1945

in the Nanpo Shoto group, was the key to the entire defense system in that group. This small island lay astride the bomber route to Japan. From its airfields U.S. planes were attacked. It had been converted into a powerful fortress. Beach defenses were organized in depth. Tactical locations were covered by all available weapons. Defenses consisted of reinforced concrete pillboxes, heavy guns emplaced in concrete, tank traps, mortars, mobile artillery, concealed caves and land mines. Beaches consisted of loose volcanic sand which, coupled with steep terrain, offered serious obstacles to men and all forms of transportation and tracked vehicles. Lieutenant General Tadamichi Kuribayashi with an estimated force of 22,000 commanded.

From June 15, 1944, until Feb. 19, 1945, naval aircraft and surface vessels assisted by heavy bombers of the 7th army air force engaged in softening up the defenses.

Admiral Raymond A. Spruance, 5th fleet, commanded the Iwo Jima operation with Vice-Admiral Richmond K. Turner as commander of the joint expeditionary force. Lieutenant General Holland M. Smith, commanding general fleet marine force, Pacific, commanded the expeditionary troops' headquarters. The 5th amphibious corps, which composed all of the actual landing force, commanded by Major General Harry Schmidt, consisted of the 3rd, 4th and 5th marine divisions. The operation was an all-navy one, with Major General Schmidt's marines making the amphibious assault. On Feb. 19, 1945, after a heavy bombardment from naval vessels and aircraft, eight battalions of the 4th and 5th divisions landed abreast on the eastern beaches. All eight battalions were ashore at 10:30 A.M. By 2:40 P.M., four regimental combat teams and both division tank battalions were ashore.

Shortly after landing of the first waves, heavy resistance developed. By 6:00 P.M. the 5th division had crossed the neck of the island and isolated the Mt. Suribachi stronghold. The 4th division had extended its beachhead 400 yd. On Feb. 23, Mt. Suribachi was captured after some of

the most bitter fighting in history. Two days later, the 3rd division, less one regiment, occupied the centre of the line, with the 4th division on the right, the 5th division on the left. The seizure of the airfields, the slow pulverizing attacks until the break-through to the sea and the final pocketing of a small number of remaining Japanese in the northwestern corner of the island ended organized resistance on March 16, 1945. The destruction of the Japanese force was accomplished by resolute troops led by experienced officers and noncommissioned officers. Only such type of troops and leadership could have overcome such a fanatical enemy.

The U.S. casualties were 4,907 dead and 15,500 wounded. The Japanese dead were 21,500 with 217 prisoners of war. The capture of Iwo Jima gave greater "Superfort" efficiency, increased the bomb tonnage of planes from the Marianas and gave fighter protection to the B-29s. In three months from March 4, when the first B-29 made an emergency landing on Iwo, a total of 852 B-29s, worth some \$510,000,000 and carrying 9,361 men, made emergency landings at Iwo. Jackson, Robert Houghwout

Jackson (1892—), U.S. jurist, was born Feb. 13, 1892, at Spring Creek, Pa. Following his graduation from Albany Law school, he was admitted to the New York bar in 1913 and practised law in Jamestown, N.Y. As counsel and in other official capacities, he served railroad, banking and telephone companies. In 1934 he was general counsel for the bureau of internal revenue in Washington, D.C. By appointment of President Franklin D. Roosevelt, he served as U.S. assistant attorney-general from 1936 to 1938, as solicitor-general from 1938 to 1939, and as attorney-

general in 1940–41. Jackson was made an associate justice of the U.S. supreme court on June 12, 1941. In May 1945 President Harry S. Truman named him chief U.S. counsel on the international military tribunal to try axis war criminals. In June 1946, while Jackson was at Nuernburg, Germany, presiding at the trials, he brought into the open a supreme court feud of long standing between himself and Justice Hugo Black following the appointment of Fred M. Vinson as chief justice of the court.

Japan

For Japan the years 1937–46 saw the fruition—into total war and total defeat—of traditional tendencies in Japanese life as they were guided by Japan's leaders to create an expansionist state; and the emergence of a new Japan turning from the past toward democracy and a peaceful future.

It is debatable to what extent supposed Japanese belief in the sacredness of the emperor and the divinity of Japan's world mission was a determining factor in the nation's disastrous course. The Japanese sense of economic inferiority received from the national myths a consolation that had some religious characteristics, and the desire of the Japanese militarists and their collaborators to seize from others what Japan wanted and did not possess found a convenient excuse in them. Thus the propaganda value of the myths was high, and they supported the community of men who controlled Japan's military, economic and political life. But there were other factors more concretely significant to Japan's development into a war machine: the interdependence of the militarists and economic monopolists who had predominated throughout Japan's modern history; the circumstance that much of the army came from the farming population and developed a group consciousness seeking alleviation of the peasants' lot through economic nationalization within Japan and rich conquests without (the army's slogan, "Manchuria is the lifeline of Japan" was an example); the extraordinary persistence characterizing the Japanese when he sets himself a goal; the islanders' instinctive fear of attack from without; the feudalistic loyalties which governed the family as the smallest unit of the state and the concomitant submergence of the individual and of broad ethical considerations; the habit of community thinking reinforced by the controls of the police state; and ignorance and misinterpretation of the character, psychology and ability of other peoples and of their resources and industrial potentialities.

The place of the emperor in the national polity was, of course, a factor of importance because of the misuse made of the throne by the military and the reverence in which the emperor as the symbolic father of the Japanese national family was universally held by the people, whether or not the individual believed the mythology. Also of importance were the faults of the Meiji constitution, which permitted Japan's rulers to disregard the diet and the rights of the people in general. The cabinet was not responsible to the diet and the house could not even control the budget; the lower chamber could be dissolved and the upper prorogued by imperial decree. One of the most vicious aspects of the system was the right of direct access to the emperor by the chiefs of staff of the army and navy without reference to the prime minister. (This was

not an affirmative fault of the constitution but was a right established by the rules of the cabinet, promulgated in 1889, which gave the war and navy ministers direct access; the privilege was later extended by custom to the chiefs of staff.)

The year 1937 opened with a successful test of political strength by the Japanese army, and from then on the philosophy of conquest which had its first expression in the abortive movement to invade Korea in 1873 was practically supreme. Those responsible for the London naval treaty had long since been driven out of power. Japan was free of naval commitments, and any lingering advocacy of a moderate foreign policy had been eliminated. Certainly big business had no quarrel with aggression as an instrument of national policy. The Zaibatsu were copartners in it with the military, and in 1937 there was no group among the economic monopolists which stood against a policy of military expansion from which they profited. In the middle of 1937, a minor clash between Japanese and Chinese troops at Marco Polo bridge near Peiping on July 7 set off Japan's undeclared war on China.

By that time Japanese military, political and economic aggression against China after 1931 and the growth of Chinese unity and nationalism—including "anti-Japanism"—had created a situation in which the Japanese momentum toward war had become so concentrated that any clash would probably have resulted in general hostilities. The ensuing "China affair" likewise carried the Japanese along a course which meant inevitable war with the U.S. and the other nations which became the Allied military opponents of Japan.

Progressive Japanese military operations in China had as a corollary progressively flagrant and widespread violation of the rights of western nations, as well as the destruction of foreign lives and property through relentless bombing of civilian and nonmilitary objectives. The sinking of the U.S.S. "Panay" in Dec. 1937 was an indication of how far individual Japanese military commanders were prepared to go. The tension between the U.S. and Great Britain on one hand and Japan on the other continued to grow without alleviation as the Japanese persisted in their aims irrespective of the rights of others, and the U.S. insisted upon the upholding of fundamental principles of international law and conduct.

In world politics, Japan abandoned its previous alignment with the democratic nations and definitely placed itself in the fascist bloc by accepting Italian adherence in Nov. 1937 to the Japanese-German anti-Comintern pact of 1936. A year after the outbreak of war in Europe the anti-Comintern pact was developed into the tripartite treaty by which Germany, Italy and Japan agreed to "stand by and co-operate with one another" in their efforts to establish so-called new orders in Europe and in east Asia. Four years after the clash at Marco Polo bridge, Japan attacked the U.S. because the U.S. continued to refuse to yield on principles whose abandonment would have meant, inter alia, the sacrifice of China.

Prelude to Aggression.—At the beginning of 1937, the army had been for some time the dominant political force in Japan. But its interference in domestic affairs (particularly the attempted military coup of Feb. 26, 1936, and the rumoured army plans for diet and administrative reforms which would completely emasculate parliamentary government) had provoked strong reaction from the political parties and the more conservative elder statesmen. The burden of the army's increasingly ambitious plans

for the exploitation of Manchuria, the procession of evergreater budgets with consequent rise in taxes and price inflation, the effects of the army's economic program of state socialization and national self sufficiency, and "unfavourable" trade balances—all alarmed influential business circles, although this was increasingly balanced by the influence of monopolistic interests which benefited from the army's rearmament program.

There was also concern over the deterioration in Japan's international position. The anti-Comintern pact (Nov. 25, 1936), sponsored by the army, and the lapsing (on Dec. 31, 1936) of the Washington and London Naval treaties increased Japan's estrangement from the democracies and soviet Russia. Most immediately important was the impasse that had been reached in relations with China, where anti-Japanese sentiment had reached widespread proportions. Prolonged conversations with the Chinese government in the autumn of 1936 for settlement of outstanding issues (chiefly Japanese desire for "economic collaboration," and suppression of communism and anti-Japanese activities) had been wrecked by the uncontrolled activities of the Japanese army in north China. Faced by continuing Japanese army pressure to broaden the autonomy of the provinces of Hopei and Chahar, by the Japanese army's creation of a puppet regime in Inner Mongolia and by the flouting of China's administrative authority through large-scale smuggling and narcotic operations by Japanese and Koreans, the Chinese government took the position that there must be a political settlement effecting restoration of China's administrative rights before there could be agreement on economic matters.

The Chinese government took this strong position for a number of reasons. The long-developing crisis in the Japanese government came to a head in the diet on Jan. 21, 1937, when Kunimatsu Hamada, a Seiyukai member, assailed the fascist tendencies of the army. Minister of war Hisaichi Terauchi demanded dissolution of the diet and, not succeeding resigned, thus forcing the fall of the Hirota cabinet. The next few days clearly demonstrated who were in control of Japan. Although the imperial mandate was given to General Kazushige Ugaki (who had a liberal reputation and was on good terms with the political parties), the army leaders refused to fill the post of war minister and thus made it impossible for him to form a cabinet.

General Senjuro Hayashi, acceptable to the army, formed a cabinet Feb. 2. Continuing criticism by the political parties impelled the government to dissolve the diet on March 31 as a "disciplinary" measure. The two leading parties, the Sevyukai and Minseito, made common cause against Hayashi and fascism, resulting in overwhelming defeat for the government and its resignation at the end of May.

The election of 1937 was the last prewar gesture of liberalism in Japan. The army and heavy industry were cementing their coalition. Leadership of the liberal groups was not united and contained strong nationalist elements. Realizing Hayashi's political blunders, the reactionaries called for a "national union" cabinet. With army behind-the-scene support, Prince Fumimaro Konoye formed what was claimed to be such a government on June 2 with a solid reactionary bloc holding the main portfolios. The future was soon decided by the actions of the Japanese army.

Undeclared War on China.-It had been an open question for several years whether Japan's expansion on the Asiatic mainland would bring it first into open conflict with China or the U.S.S.R. While soviet Russia had strengthened its position in Siberia and had shown an increasingly stiffening attitude, there was a general feeling in Japanese military circles that the communist purges in 1936 and early 1937 had greatly weakened the Red army. Apparently as a test of soviet strength and attitude toward the coming hostilities in China, the Kwantung army late in June 1937 provoked an incident over the possession of several small islands in the Amur river bounding Manchuria and Siberia. The soviet government took a conciliatory attitude and withdrew its forces from the islands, and the Japanese decided that soviet Russia presented no serious menace.

Meanwhile, tension was growing in China, where it seemed for some months that the Japanese had been marking time.

During the first week of July 1937 there was a continuous infiltration into Peiping of Japanese hirelings in plain clothes. On the night of July 7 a clash occurred at Marco Polo bridge, a few miles from Peiping, between a Japanese detachment and Chinese patrols. The Japanese de-

Nazi-styled toast in Tokyo to the Japanese-German-Italian pact signed Sept. 27, 1940, offered by (left to right) Italian Ambassador Indelli, Japanese Foreign Minister Matsuoka, German Ambassador Ott and Heinrich Stahmer, a special nazi envoy

tachment had no legal basis for its presence in the area. Three weeks of inconclusive local negotiations and local clashes ensued and, notwithstanding several truce arrangements and Chinese agreement in principle to Japanese demands, the Japanese began bringing several thousand additional troops into north China from Manchuria. At the end of July the Japanese forces launched a general attack and quickly occupied Peiping and Tientsin. There followed a brief lull in the north, but heavy fighting broke out on Aug. 13 at Shanghai between Chinese troops and the large Japanese marine garrison stationed there after the hostilities of 1932. Nanking was bombed Aug. 15 as the beginning of a Japanese air offensive in the lower Yangtze region. Large reinforcements were sent from Japan, and the offensive was undertaken over a wide area. A small group of soviet planes assisted the meagre and rapidly diminishing Chinese air force for a few months, and some soviet supplies were delivered through Hsinking.

Japan was unresponsive to offers by the U.S. and Great Britain to use their good offices toward reconciliation with the Chinese government, and practically ignored pleas by the foreign ambassadors in Nanking, headed by U.S. Ambassador Nelson T. Johnson and supported by the German Ambassador, Oskar Trautmann, to treat Nanking as an open city.

On Oct. 6, 1937, the League of Nations assembly adopted a report that Japanese military operations against China were out of proportion to the incident which occasioned the conflict, and that Japan's actions contravened its obligation under the Nine Power treaty and the Pact of Paris. On the same date a second report was adopted by the assembly in which it was concluded that the parties to the Nine Power treaty should be invited to initiate consultations in regard to the application of the stipulations of the treaty; that the assembly should express its moral support for China; and that members should consider how far they could extend aid to China. (The U.S. supported the assembly's conclusion.)

On Oct. 9, the Japanese foreign office announced that the actions of the league and the U.S. were due to lack of understanding and that China started the hostilities, that Japan had no territorial designs and had not contravened any treaties; and that the Chinese government was a menace to world peace.

In conformance with a provision of the Nine Power treaty of 1922, 19 nations, including the U.S., participated in a conference convened at Brussels to consider peaceable means for ending the conflict. The U.S. delegate was instructed that, to avoid a serious clash with Japan, some practical means must be found to check Japanese conquest, that the conference might be an agency to bring about moral pressure upon Japan to effect a change in attitude and policy. Japan refused to participate. The U.S. delegate reported at the conclusion of the conference that Japan was unwilling to resort to conciliation and insisted that its issues with China were exclusive, whereas the conference powers, except Italy, affirmed that the Sino-Japanese conference was of concern to all nations. A declaration to this effect was adopted Nov. 24, 1937.

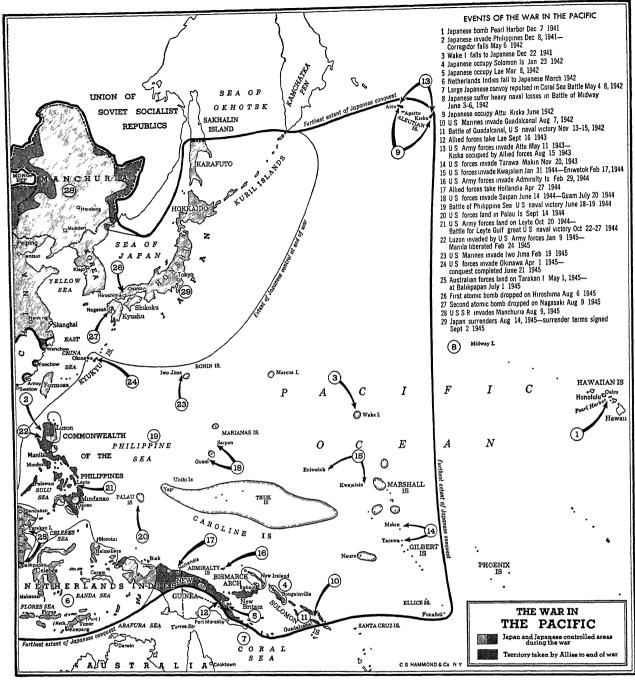

The war went on. Japanese naval contingents occupied the principal coastal ports; the main Chinese defense was broken in Nov. 1937 by a surprise landing in Hangchow bay which outflanked the exhausted Chinese forces. Nanking was captured Dec. 13, and the victorious Japanese indulged in an orgiastic campaign of murder, rape and pillage against the civil population which will be remembered as one of the blackest pages in the history of the Japanese army. On Dec. 12 Japanese planes sank the

U.S.S. "Panay," which had moved upriver, and attacked two British gunboats. Japanese "peace proposals" were put forward through the German ambassador in China but were rejected to the surprise of the Japanese military, who had apparently not planned a campaign west of Nanking and thus let the Chinese armies extricate themselves and re-form.

Principal cities of north China and railway lines had long since been occupied, with chief resistance from communist and other guerrillas. Hsuchowfu was captured in May 1938 and a campaign was launched against Hankow, the new provisional capital. By breaching the Yellow river dikes, the Chinese prevented the Japanese from using the Peiping-Hankow and Lunghai railways and forced them to fight up the Yangtze valley. In south China, Canton fell on Oct. 21, 1938, and Hankow on Oct. 27. But the Chinese were not beaten. As Chiang Kai-shek stated, they had been "trading space for time" and the Chinese government now sat in Chungking, the Japanese being held back by the mountainous terrain. While Chungking and other places were mercilessly bombed and the Japanese twice occupied and quit Changsha, the war developed into a virtual stalemate. Completion of the Burma road let in U.S. supplies, and a U.S. air route to Kunming was so developed in 1944-45 that planes were carrying three times as much cargo as had gone over the road before the 1942 Japanese Burma campaign closed it.

In 1943 Japanese troops in China and vessels in nearby waters suffered increasing attrition by the U.S. 14th air force under Gen. Claire Chennault, based at Kunming. In 1944, Chinese troops trained by Gen. Joseph Stilwell made it possible for the Ledo road and pipe line to be pushed through, and in the middle of that year B-29s based near Chengtu began attacks on Kyushu. Drives by Japanese land forces in the late fall of 1944 eliminated principal air bases in the southwest except Kunming, and in Dec. the Japanese drove to Kweiyang, one day's motor journey from Chungking, but subsequently withdrew. From then on no large-scale land operations occurred. (See also WORLD WAR II: Chinese-Japanese War.)

Domestic Scene, Pre-Pearl Harbor.—During the period from Aug. 1937 to Dec. 1941, a rapid development of economic and political mobilization and regimentation occurred which, coupled with alignment with the axis, pointed with increasing directness toward war with the western powers. A succession of controls were put into effect regulating trade, prices, industry, capital investment, foreign exchange and labour. Cartelization was completed by establishment of control associations for industries (including the natural resources industries). The first Konoye cabinet (June 4, 1937) put through some 86 bills in March and April 1938 to strengthen the war effort, including the National General Mobilization law, which laid the foundation for a command total-war economy by providing a legal basis for state control of capital, industry and labour. Two months later, Konoye "strengthened" his cabinet by selecting Seishiro Itagaki, ruthless commander in north China, as war minister and General Sadao Araki, a notorious chauvinist, as minister of education. Konoye dismissed Foreign Minister Ugaki in Sept. because of the latter's failure to come to agreement with the war office over administration with respect to China, a question which caused the cabinet to fall at the end of 1938. In his second cabinet, formed in 1940, the anti-U.S. jingoist, Yosuke Matsuoka, was foreign minister and Hideki Tojo was minister of war with Kiichiro Hiranuma, a

strong reactionary, as home minister; Koichi Kido became lord keeper of the privy seal.

On Dec. 12, 1937, the U.S.S. "Panay," a river gunboat carrying the remaining U.S. embassy staff at Nanking and a number of civilians, was bombed by Japanese planes and sunk 25 miles up the Yangtze river from Nanking. The attacking planes machine-gunned survivors going ashore in small boats and later searched for them along the river banks. Three Standard Oil tankers were also bombed, and air attack was directed against two British gunboats and a British passenger ship and hulk carrying foreign refugees further downstream; H.B.M.S. "Ladybird" was shelled at Wuhu. The Japanese authorities had requested that foreign vessels move from Nanking, and the "Panay," which had gone up river two miles on Dec. 9 as Japanese troops began to enter the capital and heavy bombing was in progress with bombs falling in the river,

was forced from its new anchorage by shellfire from shore on the morning of the 12th. The senior diplomatic officer on board, George Atcheson, Jr., radioed the Japanese authorities the position at which the ship was anchored and yet it was bombed several hours later. There was reason to believe that the Japanese government was not directly culpable, and that the attacks were due to orders to bomb all ships between Nanking and Wuhu. The incident was settled with the U.S. government, which exhibited great restraint, by apologies and indemnities.

Meanwhile (late Nov. 1937) Japanese peace terms, announced on Jan. 22, 1938, were proffered through a German intermediary: China to abandon pro-communist and anti-Japanese policies and collaborate politically and economically with Japan and "Manchoukuo"; demilitarized zones to be established "in the necessary localities" under "special regimes"; and China to pay indemnities. These

were rejected, and on Jan. 16, 1938, the Japanese government announced that it would no longer deal with Chiang Kai-shek.

Relations with the U.S. steadily deteriorated. Despite Japanese promises after the "Panay" sinking that U.S. rights would be respected in China, flagrant interference with U.S. and other interests increased, and the Japanese turned a deaf ear to protests from Washington and almost daily representations by U.S. Ambassador Joseph C. Grew and Chargé Eugene Dooman in Tokyo. The deterioration was punctuated by: (1) Japanese creation of a puppet regime at Nanking in March 1938; (2) opposition of the U.S. government to sale to Japan of aeroplane equipment and aviation gasoline; (3) stripping by Japanese sentries of foreign women at the barricades around the Tientsin British concession in the winter of 1938-39; (4) notification in July 1939 by the U.S. of forthcoming termination of the 1911 commercial treaty with Japan; (5) outbreak of war in Europe in Sept. 1939; (6) the expanding scope of Japan's avarice, apparent in 1940 from pressure on the Netherlands East Indies for economic concessions; (7) demands upon the French in Aug. 1940 for Japanese military occupation of certain places and, after Vichy French acquiescence, incursion of Japanese forces into northern Indo-China; (8) the conclusion on Sept. 27, 1940, of the tripartite pact by which Japan cast her fortunes with the axis and; (9) the deliberate bombing attack July 30, 1941, on the U.S.S. "Tutuila" at Chungking, which damaged the vessel and endangered U.S. Ambassador Clarence E. Gauss' office. A neutrality pact with soviet Russia was signed April 13, 1941, to the relief of the military, who had suffered a rude shock over Japanese casualties and soviet fighting ability in two major Manchurian-Siberian border incidents-in July-Aug. 1938 (Changkufeng) and in the summer of 1939 (Nomonhan).

Konoye was succeeded on Jan. 5, 1939, by Hiranuma, whose cabinet further tightened the wartime structure but was forced out in Aug. by the signing of the Germansoviet non-aggression pact. A new cabinet was formed under General Nobuyuki Abe on Aug. 28 which effected price controls and endeavoured to arrange for renewal of the U.S.-Japanese Treaty of Commerce to solve the "Tientsin incident" with Great Britain and to conclude a Japanese-soviet commercial treaty and fishery pact. The cabinet fell after 276 diet members called for its resignation because of its failure to cope with diplomatic developments. The next cabinet formed Jan. 16, 1940, by Admiral Mitsumasa Yonai was forced to resign in July because of Yonai's differences with War Minister Shunroku Hata, including his refusal to accept the tripartite pact. Konoye became prime minister for the second time on July 22. He dissolved the political parties on Aug. 22 and reorganized them into the Imperial Rule Assistance association, which became an authoritarian political control organ. Control was extended to include daily necessities, and in Sept. Japan concluded the tripartite pact with Germany and Italy.

After the outbreak of war between Germany and soviet Russia, Konoye reorganized the cabinet (July 18, 1941) with Tojo as war minister. On Sept. 6 it was decided at an imperial conference that conversations then going on with the U.S. should continue but that failure to make progress in a short time would require decision to prepare for war. Early in Oct. the cabinet considered (1) whether agreement with the U.S. on minimum Japanese demands no longer could be reached, and (2) whether in such case Japan should decide to prepare for war. Konoye is reported to have held that agreement with the

U.S. was still possible, provided an agreement for withdrawal of Japanese troops from China could be reached. Tojo argued that agreement with the U.S. was no longer possible, that Japan could not agree to withdraw troops from China, and that the time was ripe for Japan to make up its mind for war. The navy was far from confident of its strength but would not officially admit so, merely stating that it would support a decision by the prime minister. Tojo was thus able to force Konoye's resignation. When Tojo was selected to form a cabinet, the emperor expressed serious desire that he reconsider the question and continue the conversations with the U.S. at all costs. Tojo stated to the diet Nov. 17, that agreement with Vichy France for occupation of Indo-China was a "defense measure," and demanded that third powers not obstruct settlement of the "China incident," and that they retract economic measures against Japan. Final decision for war was taken by Japan's military rulers shortly thereafter.

U.S.-Japanese Negotiations, 1941.—The German failure to achieve quick victory and the stalemate in China gave pause to saner Japanese. Early in 1941, a suggestion was put forward through private Japanese and U.S. citizens that the Japanese government might welcome an opportunity to modify its attitude. Ambassador Kichisaburo Nomura presented to Secretary Cordell Hull a proposal for a "general settlement" based on concept of joint overlordship of Pacific areas and suggesting that the U.S. request China to negotiate with Japan, that normal trade be resumed, and that the U.S. facilitate procurement by Japan of natural resources in the Southwest Pacific. On June 21 the state department proposed, inter alia, a mutual declaration of peaceful intent; Japan was not committed to take action against the U.S. if the latter, in self-defense, should be drawn into the war in Europe. After discussion of Japanese terms, the U.S. would propose that China negotiate for peace, and nondiscriminatory access to supplies would be provided in the Pacific.

An imperial conference on July 2, 1941, was followed by the ordering up of 1,000,000 or 2,000,000 men, recalling merchant vessels in the Atlantic and full censorship. The press accentuated the familiar allegation of encirclement by the "ABCD" powers (United States, Great Britain, China and the Netherlands). On July 24 President F. D. Roosevelt proposed that he seek British, Dutch and Chinese agreement to neutralization of Indo-China. Japanese forces shortly moved into southern Indo-China and began infiltration into Siam. On July 26, Japanese assets in the U.S. were frozen. On Aug. 8 Nomura suggested that Konoye and Roosevelt meet. Following the president's return Aug. 17 from the Atlantic conference, Secretary Hull informed Nomura that further steps by Japan toward domination by force would impel the U.S. to take measures to safeguard its rights and ensure its security. On Aug. 28 the president received a definitive proposal from Konoye for a meeting. Roosevelt's reply (Sept. 3) pointed out that a prior meeting of minds on principles was necessary. Further informal U.S.-Japanese conversations ensued in Washington, largely with the state department.

On Oct. 16 Konoye was replaced by Tojo. Early in Nov. the plan for attack on Hawaii, the Philippines and British and Dutch possessions was approved, and the carrier task force for attacking Pearl Harbor moved to the southern Kuriles. The subsequent dispatch of Saburo Kurusu as a special emissary to "assist" Nomura in Washington was accordingly little more than subterfuge. When

Kurusu and Nomura had their first conference with Roosevelt and Hull on Nov. 17 no new proposals were presented. On Nov. 26, Hull handed Nomura an outline of a tentative broad agreement: mutual affirmations of policies of peace; inviolability of territorial and administrative integrity of all nations and equality of commercial opportunity; peaceful settlement of controversies; a multilateral nonaggression pact with the governments principally concerned in the Pacific area; support of the Chungking government and relinquishment of extraterritorial rights; reciprocal trade; removal of freezing restrictions; acknowledgment that no agreement concluded with any third power should conflict with these fundamental purposes. The U.S. also proposed withdrawal of foreign forces in China and Indo-China (the last of the U.S. forces were then being withdrawn from China and British forces had already been withdrawn).

Tojo described the "Nov. 26 note" as an "ultimatum," Japanese troop movements into Indo-China were intensified and the naval task force in the Kuriles received sailing orders for Hawaii (about Nov. 28).

To exhaust every effort for peace, Roosevelt on Dec. 6 telegraphed a personal message to Hirohito. (There was reason to believe that it was not delivered.) Carrier-based Japanese planes attacked Pearl Harbor at 1:20 P.M., Washington time, Dec. 7–45 minutes before Nomura and Kurusu called on Hull to inform him that "it is impossible to reach an agreement through further negotiations."

Japan's declaration of war on the U.S. and Great Britain, dated Dec. 8, 1941, was not communicated to Ambassador Joseph Grew until 11:00 A.M. Dec. 8, 7 hours and 40 minutes after the attack on Pearl Harbor. (For the subsequent military and naval developments in the Pacific and southeast Asia, see World War II.)

The War Years 1942-45 in Japan.-In Feb. 1942, the Imperial Rule Assistance association, organized in Oct. 1940, began to select candidates for the elections of April 30, which were marked by vigorous persecution of nonrecommended candidates. Three hundred eighty-one official and only 85 unofficial candidates won seats. The Imperial Rule Assistance Political society, meanwhile, had become an increasingly important part of I.R.A.A., and in June Tojo brought under its control industrial, agricultural and maritime organizations as well as youth and women's associations, and it became the co-ordinating centre of the patriotic movement. The information board was converted into a censorship, propaganda and thoughtcontrol machine backed by military police. In Sept. the Greater East Asia ministry was set up to administer the occupied areas.

The year 1943 was one of decisive battle and victory. but the public was becoming uneasy. Tojo reorganized his cabinet in the spring of 1943, bringing in three politicians and naming eight prominent men of finance and industry as advisers. As the war industries failed to reach expectation and discord between the army and navy grew more acute, Tojo made a desperate effort to co-ordinate command and administration and in Nov. set up the munitions ministry. He was then premier, foreign minister, minister of war and of education, chief of the general staff and munitions minister, with control over production of war supplies including aircraft. He also obtained authority over production and administration of ships, planes, coal, light metal, iron and food. Boys of 17 were placed on the draft list, and boys of 14 were trained for the air services. An emergency act closed most colleges and put high school boys and girls into war industries. But aircraft production could not keep up with the massing U.S. air strength; criticism mounted, causing Tojo to arrest hundreds of liberal thinkers and antimilitarists. (The postwar prime minister Shigeru Yoshida, was held over six weeks.)

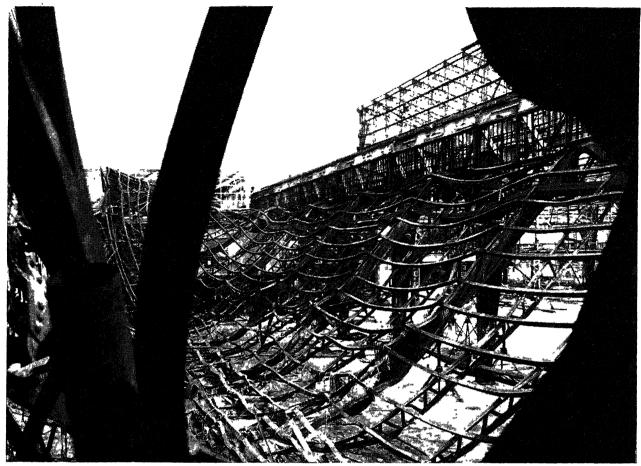

On Nov. 26, 1943, Roosevelt, Churchill and Chiang Kai-shek had issued the Cairo declaration that unrelenting pressure would be brought upon Japan by sea, land and air; that territory stolen from China would be restored; that Japan would be expelled from all territories which she had taken by violence and greed after World War I; and that Korea should become independent.

Saipan fell in July 1944. The elder statesmen as well as the public were then so alarmed that Tojo was finally forced to resign. His collapse was a turning point; victory was no longer a possibility and the war was coming close to Japan. It also marked the end of the dominance of the military. On July 22 General Kuniaki Koiso organized a cabinet which more nearly approached equilibrium among the dominant groups of the oligarchy. A council of supreme war leaders was initiated, but Koiso failed to bolster the war effort and on April 4, 1945, he resigned. (The secret Yalta agreement providing for soviet entry into the war with Japan "two or three months after Germany has surrendered" had been signed by Roosevelt, Churchill and Stalin Feb. 11.)

On April 9, Admiral Kantaro Suzuki, confidant of the emperor, formed an elder statesmen cabinet and prepared for termination of the war with hope for negotiated peace. With Okinawa as a base, B-29 attacks upon Japan developed in full force. Request for soviet good office in mediating peace was made in June. The Potsdam declaration calling for surrender was issued by the presidents of the U.S. and China and the British prime minister on July 26. The blasting of Hiroshima by an atomic bomb on Aug. 6 impelled the government to speed.

Developments Leading to Surrender.-The Suzuki cabinet, installed April 7, 1945, had as its paramount and secret task re-examination of the military situation. Reportedly Navy Minister Yonai and Suzuki, working in secrecy from the army, reached the conclusion that to continue the war would mean utter destruction of Japan. During the last ten days of June the emperor, presumably on the basis of their report which he had ordered, called an imperial conference and directed that steps be taken to end the war. Early in July it was decided to make an approach through the soviet government, which was requested to accept a special envoy from Japan. The U.S.S.R. rejoined with a request for information as to the purpose of the Japanese proposal. The Japanese government replied that the special envoy (Konoye) would be sent to discuss improvement of soviet-Japanese relations and employment of soviet good offices to bring about an end to the war. Despite urgent requests by the Japanese ambassador in Moscow, no definitive soviet reply was received before the soviet declaration of war on Japan.

Faced with the emperor's orders to bring the war to an end, the cabinet studied the Potsdam declaration of July 26, 1945, and concluded that it constituted an acceptable basis for surrender. However, almost insurmountable difficulties arose from the inability of the Japanese army to halt the momentum of war and to devise a formula for surrender; and a second imperial conference was called Aug. 9. For the first time, Japanese leaders, were unable to reach a decision at an imperial conference, and the emperor made the decision on his own responsibility. The emperor was reported to have stated that the Potsdam declaration

Mitsubishi aircraft plant in Nagoya, about 70% destroyed by B-29 incendiary raids in 1945. Larger than Willow Run, the plant assembled about a fifth of all Japanese warplanes

should be accepted; that from the very start of the war, military plans and information had been far from the facts of the situation; that continuing the war would mean destruction of the Japanese people and nation and would also be disastrous to civilization; and that termination of the war in this manner and at this time was in accordance with the "divine will" and the "destiny of the world."

The conference closed at 3 A.M. on Aug. 10, and at 7 A.M. a telegram conveying qualified acceptance of the Potsdam declaration was dispatched (without reference to the foreign office) through the Swiss government. The Allied reply, received on Aug. 13 at 5 A.M., according to Japanese sources, was hotly debated; it was necessary again to summon an imperial conference on Aug. 14 at 10:45 A.M. at which the emperor reportedly ordered the cabinet immediately to draft an imperial rescript terminating the war. The emperor broadcast the rescript directly to the people on Aug. 15.

There was fear that elements of the Japanese army would attempt a coup d'état, but owing to the efforts of officials favouring peace only minor disturbances occurred. During the night of Aug. 14–15, imperial guards mutinied, partly in an effort to find and destroy the record of the emperor's projected broadcast. Soldiers and officers appeared at entrances around the palace and prevented anyone from entering or leaving in an endeavour to forestall the broadcast. They were finally persuaded to depart peacefully. Others attacked the prime minister's residence with machine guns and burned it as well as the residence

of Hiranuma, who was reputed to have played an important role in the surrender developments.

The Suzuki cabinet, its mission completed, resigned the day of the imperial broadcast: War Minister Korekicho Anami committed suicide early that morning.

Surrender.-Japanese qualified acceptance of the Potsdam terms ("understanding that [it] does not comprise any demand which prejudices the prerogatives of His Majesty as a sovereign ruler") was received by Secretary of State James Byrnes on Aug. 10 through the Swiss chargé. On Aug. 11, Byrnes replied that "authority of the Emperor and the Japanese government to rule the State shall be subject to the Supreme Commander of the Allied Powers, who will take such steps as he deems proper to effectuate the surrender terms . . . Ultimate form of government of Japan shall . . . be established-by the freely expressed will of the Japanese people," and, "the armed forces of the Allied Powers will remain in Japan until the purposes set forth in the Potsdam Declaration are achieved." On Aug. 14 the Swiss chargé forwarded a statement from the Japanese government that the emperor had issued a rescript regarding Japanese acceptance of the Potsdam declaration.

The unconditional surrender of Japan was announced by President Truman on Aug. 14. General Douglas MacArthur, in Manila, assumed command as supreme commander for the Allied Powers (S.C.A.P.). On Aug. 17 the Japanese government notified MacArthur that the emperor had ordered hostilities to cease. Japanese emissaries reached Manila by air on Aug. 19 to receive requirements for surrender, and departed the next day. On Aug. 28 a U.S. advance party arrived by plane at Atsugi—the first

invasion of the Japanese home islands by foreign military forces in modern history. MacArthur and Gen. Robert L. Eichelberger, commander of the occupation forces, arrived by plane on Aug. 30. On Sept. 2 the surrender instrument was signed aboard the U.S.S. "Missouri" in Tokyo bay by Foreign Minister Mamoru Shigemitsu on behalf of the Japanese emperor and government and General Yoshijiro Umezu on behalf of imperial general head-quarters. MacArthur signed as supreme commander for the Allied Powers (S.C.A.P.), followed by representatives of the U.S. (Admiral Chester Nimitz), China, U.K., U.S.S.R., Australia, Canada, the provisional French government, Netherlands and New Zealand. U.S. troops continued to land. There was no resistance; no hostile shot was fired.

From Defeat Toward Democracy.-In surrender the Japanese experienced a profound psychological convulsion. The emperor ordered them to co-operate with the occupation authorities, and it was soon apparent that they did so willingly. Much of the friendliness which developed was due to the conduct of the U.S. troops. Japanese relief at the war's end was heightened by the discovery that they were not to be murdered, beaten, raped and pillaged. Resentment turned against past leaders and many Japanese looked upon the U.S. troops as liberators. This did not mean that former forces had been dissipated, that the oligarchy would not attempt to salvage itself or that political and social thinking had been wholly reformed. But there was no doubt that the people-war-weary, disillusioned, bewildered almost to apathy-had learned that the past had betrayed them and that their hope lay in a new kind of future.

The basic U.S. directives, followed within a year by adoption of a new constitution, set up framework for democratic life. Ultimate results were, of course, still to be defined. But the vigour of a press set free, widespread participation in the April 1946 elections by newly enfranchised men and women, resurgence of the labour movement, undreamed-of new life for the submerged peasant farmer, birth of freedom for teachers—all attested to opportunities of far-reaching significance. This new and groping Japan, emerging from the chrysalis of the old, merited examination in the light of Allied interests.

It fell to the U.S. to take leadership in sacrifice and effort to encompass Japan's defeat and carry on the first months of occupation. It fell to the U.S. to formulate and effect initial post-surrender policies. Before the surrender, the U.S. proposed establishment of a far eastern advisory commission, but it was not set up until after the war and was not reconstituted until Feb. 1946 into the Far Eastern commission (one representative of Australia, Canada, China, France, India, Netherlands, New Zealand, Philippines, United Kingdom, U.S.S.R. and U.S., with the latter chairman). The Allies subsequently gave general approval to U.S. policies. With inauguration in April of the Allied Council for Japan (pursuant to the Moscow communique, Dec. 27, 1945) the regime comprised: (1) the commission in Washington for formulation of policies; (2) the U.S. government for issuance of directives embodying Allied policy and interim directives; (3) the supreme commander (S.C.A.P.) as sole executive authority; and (4) the council (one member for the U.S.S.R., British commonwealth and China, and the supreme commander or his deputy, George Atcheson, Jr., as chairman and U.S. member) to consult with and advise MacArthur.

The basic policy was in part as follows: to ensure that Japan would not again be a menace to peace and security;

to bring about establishment of a government which would respect the rights of other states, support the ideals of the United Nations charter and conform to democratic principles ("it is not Allied responsibility to impose any form of government not supported by the freely expressed will of the people"); to limit Japan's territory to Honshu, Hokkaido, Kyushu, Shikoku and minor outlying islands; to demilitarize Japan completely and eliminate the influence of militarism; to encourage development of individual liberties and respect of human rights; and to permit an economy which would meet peacetime requirements of the population. It provided also for military occupation with participation of appropriate Allied forces under command of S.C.A.P. (designated by the U.S.); for subjection of the authority of the emperor and government to S.C.A.P. and exercise of his authority through Japanese governmental machinery to the extent that this furthered

Japanese repatriates, mainly war widows and children, in their quarters below deck on a small merchant ship carrying them from Shanghai to Japan in 1945

occupation objectives; and denial to Japan of an army, navy, air force, secret police or civil aviation. It stipulated further that important military and naval officials and exponents of militarism and aggression would be taken into custody. Democratic organizations would be encouraged and the economic basis of military strength would be destroyed. Wide distribution of income and ownership of production and trade would be favoured, monopolies dissolved and reparations made.

It was this broad pattern which General MacArthur, virtual ruler of Japan, administered in detail in the ensuing months with wisdom, understanding of the Japanese, tolerant leadership and high statesmanship.

Demobilization and Demilitarization.—The landing of two and one-half U.S. divisions (combined air and seaborne landings supported by sea and air patrols) into the armed camp of 57 divisions that was Japan in late Aug. and early Sept. 1945 was aptly described as the greatest military risk in history. There was no opposition. Demobilization proceeded rapidly through use of Japanese demobilization machinery; 2,576,085 Japanese troops within the home islands were demilitarized by December. The remainder, totalling 5,852,000, were spread from Manchuria to the Solomons and across the islands of the Central and Southwest Pacific, as were 1,300,000 navy personnel.

Of the remaining 3,147,000 army and 234,000 navy personnel in overseas areas, all were disarmed in southern Korea, the Philippines, Ryukyus, Volcanos, Siam, Malaya, Borneo, the Celebes and the Lesser Sundas, with some 18,000 remaining armed in Sumatra and Java. Most of the original 1,542,000 troops in China (exclusive of Manchuria) and the 165,000 in Formosa were disarmed. (The status of Japanese troops which fell into soviet hands, estimated at 800,000, remained unknown.) A program instituted by S.C.A.P. early in Sept. 1945 to repatriate 5,500,000 persons, including civilians, was practically completed by June 1946.

The first echelon of a British commonwealth occupation force arrived Feb. 1, 1946. There were no occupation troops assigned by the soviet government.

Trial of Major War Criminals.—On Nov. 17, 1945, the Japanese government was given its first directive to deliver to prison listed major suspects. On Jan. 19, 1946, MacArthur issued the charter for the International Military tribunal at Tokyo. The U.S., China, United Kingdom, U.S.S.R., Australia, Canada, France, the Netherlands, New Zealand, India and the Philippines nominated members.

The suspects indicted when the tribunal opened May 3, 1946, were: Baron Sadao Araki, Gen. Kenji Doihara, Col. Kingoro Hashimoto, Field Marshal Shunroku Hata, Baron Kiichiro Hiranuma, Koki Hirota, Naoki Hoshino, Gen. Seishiro Itagaki, Okinori Kaya, Marquis Koichi Kido, Lt. Gen. Hyotaro Kimura, Gen. Kuniaki Koiso, Gen. Iwane Matsui, Yosuke Matsuoka (who died during the trial), Gen. Jiro Minami, Lt. Gen. Akira Muto, Fleet Adm. Osami Nagano, Takasumi Oka, Shumei Okawa (who was declared insane), Lt. Gen. Hiroshi Oshima, Kenryo Sato, Mamoru Shigemitsu, Adm. Shigetaro Shimada, Toshio Shiratori, Teiichi Suzuki, Shigenori Togo, Hideki Tojo (who shot himself but recovered) and Yoshijiro Umetsu. General Tomoyuki Yamashita, Japanese commander at the time of the infamous "Bataan death march" and General Masaharu Homma were tried in Manila and executed; Field Marshal Count Juichi Terauchi died in British custody in southeast Asia.

Forty-nine more major suspects were ordered apprehended by Aug. 31, 1945, and some 825 minor suspects had been charged for trial by military commission. (See also WAR CRIMES.)

Postwar Political Parties.—After surrender, former political leaders became active in forming new parties and sought to give a democratic hue to the organizations which came into being in Nov. and Dec. 1945. The communist leaders, released after some 18 years in prison, were later joined by Sanzo Nosaka, who had spent several years in Moscow and later was with the Chinese communists in Yenan. Former proletarian and labour leaders formed the Social Democratic party whose complexion varied from extreme left to right. Remnants of the former leadership of the Seiyukai organized the conservative Liberal party. Former Minseito leaders organized the Conservative Conservative Minseito leaders organized the Conservative Liberal party.

ative Progressive party. A Co-operative party was founded by 27 diet members and heads of national co-operatives.

The Progressives, Liberals and Co-operatives advocated retention of the emperor (which appealed to at least 90% of the people); the Social Democrats held that too much power was vested in the emperor, while the Communists reverted to their demand for establishment of a "democratic republican government." Economically the Progressives stood for moderate government control; the Liberals maintained that excess population could be employed only by intense industrialization and a laissez-faire economy; the Social Democrats favoured nationalization of industries as opposed to the Co-operatives' plan for a co-operative community. The Communists advocated free distribution of land to working farmers and abolition of "monopolistic capitalism." Only the Progressive and Communist parties advocated full equality for women. All except the Communist party favoured government-proposed draft constitution.

After the election, the strength of the parties in the diet as of Aug. 31, 1946, was: Liberals 149, Progressives 105, Social Democrats 97, Co-operatives 43, Communists 6 and Independents 66.

Economic and Educational Programs.—While Japan's industrial potential had not been greatly reduced, defeat found the wartime economy broken. Industry, lacking workers and raw materials, was at a standstill. An unbalanced, unsound economy was left, cut off from the Asiatic mainland with which it had become integrated. The occupation began with serious shortages of food, housing and clothing.

Among the first steps taken by S.C.A.P. was the issuance of directives instituting foreign exchange controls, continuing price controls and rationing, and requiring removal of food from hoarded stocks into normal distribution. A government campaign to eliminate the black market was supported, and foodstuffs were imported from the U.S. Procedures were established to permit conversion of war plants. The U.S. Commercial company, agent for S.C.A.P., effected exports during the first year estimated at \$26,000,000 to pay for essential imports, primarily food. A Japanese economic stabilization board co-ordinated wage and price controls, allocated critical raw materials and stimulated business recovery. As a result of the Pauley Reparations mission, some 600 arsenals, aircraft plants and military laboratories were taken into custody and by Sept. 1946, 750 plants in 8 basic industries were selected for further implementation of the program. The holdings of the 14 major families of the Zaibatsu were frozen, and 1,189 firms linked in this system were restricted to S.C.A.P. approval of transfer of assets. The government created a liquidation commission to sell Zaibatsu securities. The Mitsui, Mitsubishi, Sumitomo and Yasuda combines submitted plans for dissolution and on Nov. 6, 1945, the government was directed to present a program for laws to eliminate monopolies.

The first draft legislation was inadequate, but study of a revision ensued. The control associations were also abolished.

At the end of the first year of occupation, inflation was continuing and shortages of raw materials persisted. While food prospects improved, the difficulty of restoring the nation's economic life remained the major problem facing the government.

When hostilities ceased, the educational system was at a virtual standstill. But within a year some 18,000,000 stu-

dents were attending 40,000 schools. Under a S.C.A.P. directive (Oct. 22, 1945), transformation into a democratic system began with elimination of militaristic and ultranationalistic personnel. Military training courses and state Shinto doctrine were removed; courses in geography, Japanese history and morals were suspended. Rewriting of objective textbooks was undertaken. Radio, press, motion pictures and other media were used, and operation of a free and democratic press was furthered. A U.S. educational mission visited Japan in March 1946, and in due course submitted comprehensive recommendations.

Political Progress of the First Year.—A cabinet under Prince Naruhiko Higashi-Kuni was formed Aug. 16, 1945. With the military backbone and driving power of government eliminated, it was an inept stopgap cabinet in the face of overwhelming problems of food and shelter and general rehabilitation of the economy. The emperor made his first call on Gen. MacArthur on Sept. 26. The cabinet collapsed a week later as a result of the S.C.A.P. civil liberties directive which required ordered release of political prisoners (which the cabinet had negatively considered) and insisted upon freedom of expression. Incidentally it required removal of Home Minister Yamazaki.

After four days, Kijuro Shidehara, one-time foreign minister in the Minseito cabinet (1924-29) and former ambassador to the U.S. who had long been politically inactive, formed a cabinet selected in part from the point of view of their unobjectionableness. In neither approving nor disapproving, MacArthur implemented his wise policy of nonintervention except in case of necessity. Uncertainties of the program of war crimes arrests hung ominously over the Shidehara cabinet and the diet; there were persistent vernacular press campaigns for governmental self-purging.

Communist demonstrators headed toward the Tokyo residence of Premier Shidehara on April 7, 1946, demanding the resignation of his cabinet. Two weeks later, the premier and his cabinet resigned

As result of Shidehara's first meeting with MacArthur Oct. 11, he undertook steps toward constitutional revision. On Nov. 26 the 89th extraordinary session of the dict convened to revise the election law and enact bills amending wartime financial and other controls and to permit organization of labour. The resulting election law provided for women's suffrage—first and most far-reaching step in women's emancipation from feudalism—and lowered the voting age from 25 to 20 and candidacy age from 30 to 25. An Agricultural Lands Adjustment law provided for transfer of land under a five-year plan from absentee landowners to tenant farmers (it was later greatly liberalized by revision undertaken at S.C.A.P. instance). A Trade Union law guaranteed right to organize and bargain collectively, but also required subsequent revision.

Meanwhile, more major war criminal suspects were ordered arrested, including Konoye, who took poison and died, and Kido. Divorce of Shinto from state support by S.C.A.P. directive of Dec. 15 was calmly accepted. A significant move in reorientation of feudalistic thought was a rescript issued in ordinary language Dec. 31, in which the emperor denied his reputed divinity and the theory of Japanese racial superiority. Later the emperor undertook tours which included visits to factories as part of a program to be in touch with the people.

Two S.C.A.P. directives were issued Jan. 4, 1946: for "removal and exclusion of undesirable personnel from public office" and for abolishment of nationalistic political organizations. There were profound effects; by Aug. the government had screened 5,520 office holders, 3,384 diet candidates, all elected members of the diet and members of and nominees to the house of peers; removed 814 rank-

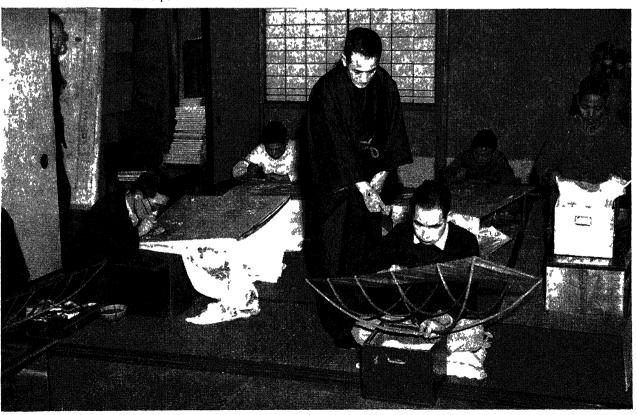

ing officials, 9 new diet members (plus Hatoyama, the Liberal party leader, removed by S.C.A.P. as he was about to be named premier), 6,202 under the "Civil Liberties directive" and 252 diet candidates; in all, excluded from office 186,000 persons. The directives also caused reorganization of the cabinet; made 90% of the diet ineligible for reelection, and brought about 30 new appointments among prefectural governors. The estimate of barred Progressive candidates was 200 of their 272 old diet members. The Liberals lost 12 former diet members.

The new draft constitution was published March 6, 1946, with approval by MacArthur, who expressed "deep satisfaction" with it, gave especial praise to the provision abolishing war as a sovereign right and stated that the Japanese now "turn their backs firmly upon the mysticism and unreality of the past and face instead a future of realism with a new faith and a new hope." The draft was a model of democratic thinking. By its terms, sovereignty rested with the people, the emperor was deprived of important political functions and became chiefly a symbol of the state; peerage and privy council were abolished; the diet became the highest state organ. The cabinet was made responsible to the diet. The lower house, controlling the budget, became the real power. A Bill of Rights as far-reaching as that of the U.S. was adopted. All leading political groups except the Communists expressed general approval of the draft. The house of representatives might be dissolved by the cabinet but in such event a general election must be held within a short time. A house of councillors, composed of elected representatives of the people, replaced the house of peers, had to be closed whenever the house of representatives was ordered dissolved and could not prevent legislation providing a bill was passed a second time by the house of

Japanese home industry in 1946. Hand painted silks finished in this shop were to be fashioned into kimonos, a profitable luxury article for export

representatives with a majority of two-thirds of members present. Qualifications of electors and members of the house of councillors were to be fixed by law without discrimination because of race, creed, sex, social status or family origin. In time of national emergency the house of councillors might be convoked by the cabinet in emergency session even when the house of representatives had been dissolved. Measures passed by the house of councillors at such sessions would become null and void unless agreement of the house of representatives was obtained within ten days after the opening of the next session of the diet. All meetings were to be public except when sessions meanera were voted by a majority of two-thirds or more of the members present.

General elections were held April 10, 1946, with the paramount question of the draft constitution. Almost 3,000 candidates competed, and nearly three-fourths of those qualified voted (26,000,000), including women. The elections demonstrated that the people were taking deep interest in the political revolution, and that their conservative tendencies continued to predominate. Criticism of the government increased. A demonstration of 30,000 organized by left wing Social Democrats and Communists gathered April 7 in a Tokyo park and rioted before the prime minister's residence. The Communists advocated a general strike. The cabinet finally resigned April 22 and a month of negotiation elapsed. The premiership was given to the new head of the plurality Liberal party, Shigeru Yoshida, former ambassador to London and foreign minister in the Shidehara cabinet. On May 20 he composed a cabinet chiefly of Liberals and Progressives which, although not well received by the press, was a step forward because of the democratic methods responsible for its formation and also because it undertook its heavy

tasks with initiative and a sense of responsibility.

Meanwhile, for the first time in a decade, May day was celebrated in the principal cities by approximately 1,000,-000 people. Other demonstrations followed and, consequent upon some acts of violence, MacArthur issued warning that while every possible rational freedom of the democratic method had been permitted, undisciplined violence would not be permitted. Discussion of communistic tactics arose in the public meetings of the Allied council. The chairman and U.S. member, Atcheson, stated for the benefit of the Japanese people that the U.S. did not favour communism in Japan. The draft constitution was the principal matter before the 90th session of the diet which opened June 20. It was approved by the lower house on Aug. 24 and passed by the upper chamber on Oct. 6, with amendments which were concurred in by the representatives the next day. Promulgation was set for Nov. 3, with the constitution to go into effect six months later.

The essential scaffolding for democratic political life was now erected. There was still much to be accomplished. While the Japanese people had progressed beyond all expectations, the road from defeat to democracy remained a long one over which, having been given assistance and guidance, they had in the final analysis to make their own way. As the government proceeded to act upon its own, fewer directives were issued pursuant to MacArthur's wise policy of encouraging the Japanese to seek the accomplishments of Allied goals which were becoming their own.

* * *

WHAT HAD the Japanese people lost? The gigantic military machine of the former Japanese empire whose cost bound the people to low standards of living had been completely destroyed. The tremendous military organization-approximately 4,000,000 organized and armed men in the home islands and 2,500,000 abroad-had been liquidated, and within another year the approximately 1,000,000 prisoners of war still in overseas areas would be added to the millions already returned to peaceful civilian pursuits. Thousands of military and civil aircraft, millions of weapons, vast quantities of ammunition-produced at an untold cost in treasure and toil-had been destroyed. The Japanese navy no longer existed; such of its ships that remained afloat at the time of the surrender were destroyed, scrapped or held for Allied division, and every element of Japanese industry utilized for, or capable of adjustment to the making of implements of war had either been destroyed or taken under complete Allied, control. The cost to the Japanese people of war-making was never compiled. In 1944-45, the budget figures for disbursements for the military alone amounted to 83% of the government's expenditures. That almost unbearable burden on their lives had been lost to the Japanese people.

Within the year after surrender, the Japanese people had come to comprehend the enormity of their betrayal by their leaders. With their feet set on paths of peace, they had lost the spirit of aggression, perhaps forever. The policies of Japanese leaders brought upon the Japanese people great economic destruction and left them faced with difficulty and suffering. Prosperity and comfort had been lost to them but not the prospect of a peacetime economic security whose benefits would be more widely distributed than before as they erected a new structure of peacetime livelihood.

What had the Japanese people gained through defeat and liberation? The masses were no longer regimented, the people no longer enslaved. The common man no longer cringed in the presence of police or other public authority. His home had become his castle, free from unwarranted intrusion, observation or violence. He worshipped as he chose. He registered his opinion on public issues, uncontrolled except by his own conscience. He enjoyed the right of assembly and petition. He enjoyed the right, individually or collectively with his fellow workers, to demand correction of unjust labour practices and conditions. His children, 18,000,000 of whom had returned to school, enjoyed the right to liberal and free education. Long and effective strides had been made in reshaping the Japanese government to conform to the principles inherent in a democratic state, so that the people might readjust their lives to compose a truly democratic society.

A new constitution, evolved from many months of widespread public interest and unrestricted debate, had been adopted. Designed effectively to curb abuse of power by individual, class or government, the new national charter placed sovereignty squarely in the hands of the people upon whom it bestowed full measure of human freedom. Electoral discrimination was removed, and the basic franchise was extended by the granting of suffrage to women and reducing the voting age limit from 25 years to 20. In the general elections of April 1946, a far greater number of those eligible to vote participated than in any other election in Japanese history. The women of Japan, breaking from their traditional retirement from the family circle, elected 39 women members of the house of representatives. Reform had been instituted in every element and echelon of the governmental structure and in every phase of governmental administrative procedure, to root out the evils of entrenched bureaucracy which had helped lead to totalitarian controls. Those who had preached the doctrine of militarism, expansionism and intense nationalism, and shaped the policies responsible for Japan's unholy and disastrous venture, were barred from governmental service to make way for a new leadership. The corporate and personal resources of the 14 major families, including the four big Zaibatsu groups with the approximately 1,200 firms linked in this system, were in process of liquidation with all principal officers and influential members of this industrial empire being ousted. Thus, the economic strangle hold upon the people in restriction of free enterprise, made possible by close alliance between government and concentrated wealth, was inexorably broken. Striking at the roots of feudalism, an agrarian reform program was begun to enable some 2,000,000 tenant farmers to purchase the lands they worked. Shaped to break down the large land holdings into two and one-half to ten-acre parcels, with their disposal provided for under conditions which would permit their ready acquisition, this program was designed to correct one of the notorious evils which had long plagued individual economy and held in serfdom the underprivileged agricultural workers

Few Japanese would not say that the gains immeasurably overweighed the losses.

At the surrender ceremony on the U.S.S. "Missouri" on Sept. 2, 1945, General MacArthur stated:

Nor is it for us here to meet, representing as we do a majority of the peoples of the Earth, in a spirit of distrust, malice or hatred. But rather it is for us, both victors and vanquished, to rise to that higher dignity which alone befits the sacred purposes we are about to serve, committing all of our peoples unreservedly to faithful compliance with the under-

takings they are here formally to assume. It is my earnest hope and indeed the hope of all mankind that from this solemn occasion a better world shall emerge out of the blood and carnage of the past—a world founded upon faith and understanding—a world dedicated to the dignity of man and the fulfillment of his most cherished wish—for freedom, tolerance and justice . . . As Supreme Commander for the Allied Powers I announce it my firm purpose, in the tradition of the countries I represent, to proceed in the discharge of my responsibilities with justice and tolerance, while taking all necessary dispositions to insure that the terms of surrender are fully, promptly and faithfully complied with.

This was the course charted, this was the course held to in conformity with the provisions of the Potsdam declaration and the basic post-surrender policy. In the latter document it was stipulated that an objective of the occupation was to bring about eventual establishment of a peaceful government which would respect the rights of other states and support the ideals and principles of the charter of the United Nations; and that while it was

desired that such government should conform as closely as possible to principles of democratic self-government, it was not the responsibility of the Allied Powers to impose upon Japan any form of government not supported by the freely expressed will of the people.

By these terms the future lay squarely on the shoulders of the Japanese people. They had been given liberty and the framework for a new life, and it was for them in the last analysis to work out their own destiny. Jeffers, William M.

Jeffers (1876—), U.S. railroad executive, was born Jan. 2, 1876, in North Platte, Neb. He started with the Union Pacific railroad in 1890 as an office boy and worked his way up until he was president of the road in Oct. 1937. On Sept. 15, 1942, Donald Nelson, War Production board chairman, appointed Jeffers U.S. rubber administrator and gave him the task of executing the Baruch committee's proposals for tire conservation, gasoline rationing and expansion of synthetic rubber production. Jeffers carried out this difficult program in spite of innumerable disputes with the army, navy and government agencies. He resigned in Sept. 1944 to return to his position with the Union Pacific. On March 22, 1946, Jeffers announced his retirement as president of the railroad.

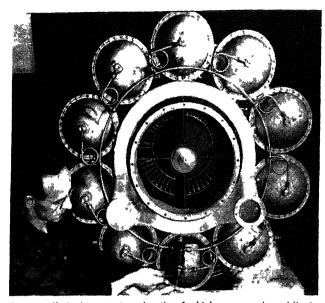

Jet Propulsion

After World War I the aeroplane power plant had been for years not only steadily improving in performance but also growing in complexity. The increase in power called for by the demand for larger and faster aircraft had been met by adding more cylinders and raising the boost pressure by the use of a supercharger. The flexible use of this power had been improved by the development of automatic power and fuel controls, but it was growing increasingly clear that these processes could not continue indefinitely and that a fresh start on new lines would have to be made. Aeronautical engineers had been interested for many years in the possibilities of propelling aircraft by means of reaction jets but the absence of a power plant suitable for producing the jet had prevented the practical realization of these ideas. Another difficulty had been the

low efficiency that would have resulted from the use in a low-speed aircraft of the comparatively high-speed jets necessary for propulsion. The internal combustion or gas turbine was another old idea which had remained little more than an engineers' dream for many hundreds of years. The difficulty with this engine had been partly the absence of materials suitable for continuous operation at high temperatures and partly the lack of an efficient means of compressing the air. But slowly, almost imperceptibly, progress was being made by increases in knowledge in various branches of engineering. The development of hightemperature alloys for the exhaust valves of internal combustion engines, the improvement in superchargers for aeroplane engines and the increase in the understanding of aerodynamics were all essential foundation stones on which future structures were to be built.

In several countries opinion began to harden round the practicability of the gas turbine and the first halting steps to achieve it were taken. But it was not until 1930 that Frank Whittle, then a cadet at the royal air force college, Cranwell, England, recognized that the very high air consumption of the gas turbine made it a particularly suitable power plant for producing a reaction jet, and he conceived the idea of the jet propulsion gas turbine. The Power Jets company was formed to exploit Whittle's ideas. Ideas of a similar kind had also been developing in Germany and work had started in 1936 at the Heinkel factory on the design of a jet propulsion gas turbine.

At the beginning of 1937 the first jet propulsion gas turbine engine was completed. This engine, known as type U, was manufactured by the British Thomson Houston Co., Rugby, England, for Power Jets Ltd., to the designs of Frank Whittle. The engine consisted of a double-sided centrifugal compressor driven by a single-stage turbine. The air from the compressor passed to a single combustion chamber in the form of a curved pipe wrapped round the outside of the turbine casing. The hot gases from this chamber were led to a volute connected to the turbine entry. The exhaust from the turbine passed out axially in a high-speed jet. The engine ran under its own power for the first time on April 12, 1937, and during the summer of that year testing continued intermittently. The principal difficulty encountered was that of obtaining satisfactory combustion; after numerous modifications had been tried it was decided to make a major change in the combustion chamber layout. The new arrangement, though showing advantages over the old, was still not good enough and, when testing was held up by a turbine blade failure, the opportunity was taken in 1938 to make a second change in the combustion layout. The new system, incorporating ten reverse-flow combustion chambers spaced symmetrically round the outside of the turbine casing, constituted the basic layout used in all the later Power Jets engines. Although progress was still hampered by combustion troubles which prevented the engine from achieving its designed figures, its performance was sufficiently good to justify greater resources being expended on solving the problems of jet propulsion. Accordingly the air ministry, in the summer of 1939, placed a contract with the Gloster Aircraft Co. for an experimental jet propulsion aircraft to the specification E28/39 and ordered from Power Jets an engine, known as the W.1, to power it. The W.1 was an improved version of the final form of the U-type engine. It passed a 25-hr. special category test at a thrust of 850 lb. in April 1941 and flew for the first time in the E28/39 aircraft on May 14, 1941. The company followed up this suc-

Jet-propelled plane engine, details of which were made public in 1945 by the U.S.A.A.F. This is a rear view, with the exhaust assembly removed to show the turbine, the one moving part. Air is compressed, forced into the combustion chambers which ring the engine, mixed with kerosene, and burned at more than 1,500° F. The hot gases pass through the turbine wheel, thus driving the compressor, and out through the jet exhaust

cess with a series of engines of improved performance but to the same basic design. Of these the W.2B designed in 1940 represented the prototype of the Welland engine, which was subsequently used in Meteor 1 aircraft. The series culminated in 1945 with the W/700 which developed about 2,200 lb. thrust.

While the W.1 and W.2 engines were still under construction and before any running experience had been obtained, apart from that on the original U-type engine, the air ministry took the farsighted decision to plan for production. To this end the drawings of the W.2 engine were handed over to the Rover company in 1940. The W.2 engine in its original form proved unsatisfactory and the Rover Co., whose original function had been production alone, soon found itself engaged in development. In this capacity it produced the W.2B.26 engine which differed from the earlier Whittle layouts in having straight-through instead of reversed-flow combustion chambers. This engine ran early in 1942 and served as the prototype for later engines produced by Rolls-Royce.

Early in 1943 the Rover company's responsibilities for gas turbine work were taken over by Rolls-Royce, who completed the production of the W.2B engine for the Meteor aircraft. This, the first production gas turbine engine, was known as the Welland and developed a static thrust of 1,600 lb. with a specific weight of 0.53 lb. per pound of thrust and a specific fuel consumption of 1.12 lb.hr. per pound of thrust. The next Rolls-Royce engine was based on the straight-through W.2B.26 engine of Rover's and was known as the Derwent I. This engine, which developed 2,200 lb. thrust with a specific weight of 0.43 and a specific consumption of 1.15, was fitted in the Meteor III aircraft. It underwent considerable development during the following years and in 1945 as the Derwent V it developed 3,500 lb. thrust with a specific weight of 0.28 and a specific consumption of 1.00 in the Meteor IV aircraft. While this development was proceeding Rolls-Royce produced a larger engine known as the Nene, but to the same general formula as the Derwent. This engine developed a 4,500 lb.

thrust with a specific weight of 0.29 and a specific consumption of 1.06. This rapid development of a range of very high performance engines by Rolls-Royce during the years 1943-45 represented a remarkable advance in the detail design of jet propulsion engines.

In 1941 Maj. Frank Halford, later of the De Havilland Engine Co., was asked by the ministry of aircrast production to work on a jet propulsion engine. It was designed in the light of experience already gained at Power Jets and elsewhere. This engine, known first as the H.1 and later as the Goblin, had a single-sided centrifugal compressor, straight-through combustion chamber and single-stage turbine. The engine first ran in 1942 and flew in 1943 in an Fg/40 aircrast. The engine started its lise with a rating of 2 000 lb. static thrust, but this was increased by progressive development to more than 3 000 lb.

The Axial Engine.-While Whittle's ideas were developing at Power Jets and were inspiring the design of centrifugal type engines at Rolls-Royce and De Havilland, a parallel development had been started by workers at the Royal Aircrast establishment. They had come to the conclusion that for the aircrast gas turbine the axial type of compressor, because of its higher efficiency and lower frontal area, was more suitable than the centrifugal type. A number of machines based on their designs and all incorporating axial compressors were constructed. The earlier designs were for engines to drive propellors, but at the outbreak of World War II in 1939 the necessity for getting quick results forced a decision to change over to the simpler form of jet propulsion engine. The construction and subsequent development of the first English axial jet propulsion engine was entrusted to the Metropolitan-Vickers Electrical Co., Ltd. The design of this engine, which was known as the F/2, was started at the Royal Aircraft establishment in 1939; the first engine ran in 1941

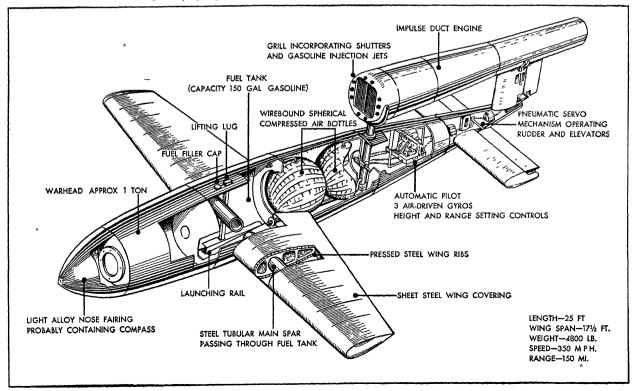

V-1, the German flying bomb, in a provisional sectional drawing. More than 9,000 of the pilotless, jet-propelled planes crossed the coasts of Great Britain during 1944 and 1945, causing about 6,000 deaths as well as widespread property destruction

and flew in the F9/40 aircraft in 1943. The engine consisted of a nine-stage axial compressor driven by a two-stage turbine with an annular combustion chamber. The original rating of the engine was 1,800 lb. static thrust, but by 1946 the Series 4 design developed more than 3,500 lb. thrust with only small increases in engine size and weight.

Research in the United States.—In the U.S. it was considered undesirable to distract the aeroengine firms from their work on piston engines, and the initial work of developing the jet propulsion gas turbine was placed in the hands of the General Electric company and the Westinghouse Electric company.

In Oct. 1941 a team of Power Jets engineers was sent from England to the United States, taking with it the Whittle W.1 engine and drawings of the W.2B engine. With the information thus provided General Electric first constructed an engine known as the I.A. based on the deeign of the W.I.X. At the same time a contract was placed with the Bell Aircraft company for an aircraft in which to fly the engines. The engine had its first run in March 1942 and gave a performance similar to that of its British prototype. The first flight of the aircraft, known as the Bell P.59, with its two I.A. engines took place in Oct. 1942. The G.E.C. followed up the type I.A. with a number of engines of greater power and improved design. These engines were generally of the same basic formula, but, as in England, a change was made from the contra-flow to the straightthrough type of combustion chamber. Among them were the I.16, which first ran in April 1943 and developed 1,600 lb. thrust, and the I.40, which first ran in Jan. 1944 and developed about 4,000 lb. thrust.

Concurrently with the development of the centrifugal engine, work had been proceeding, but on lower priority, on the axial-flow type of engine. The Westinghouse company began its development with a small engine of 19-in. diameter, known first as the 19.A engine and later as the

The Viper, a German jet interceptor launched by rockets from a modified gun mount and capable of soaring 30,000 ft. in less than a minute

Yankee. This engine ran for the first time in 1943 and developed 1,360 lb. thrust with a specific fuel consumption of 1.35 lb.hr. per pound of thrust and a specific weight of 0.61. It had a six-stage axial compressor, an annular combustion chamber and a single-stage turbine. The 19.A was later developed in performance and other engines of larger and of smaller capacity were developed along similar lines. The General Electric Co. also entered the axial field. At first it confined its attention to an axial engine for propeller drive, but in 1943 it embarked on an axial jet propulsion engine. This engine was known as the T.G.180 and carried out its first test run in 1944. The T.G.180 had an axial compressor of 11 stages, with pipe type straight-through combustion chambers and a single-· stage turbine. It developed a thrust of about 4,000 lb. with a specific weight of 0.57.

The end of World War II found the development of jet propulsion in the U.S. severely handicapped by the shortage of engine firms with gas turbine experience. In 1946 the outlook and plans of the aircraft industry had not been sufficiently defined for clear trends of development to be detected.

German Research.-The pioneering work on jet propulsion in Germany started at the Heinkel factory in 1936. The basic design of engine, from which a long chain of development later proceeded, consisted of a compressor having an axial stage followed by a centrifugal impeller, an inward-flow turbine and a contra-flow combustion chamber. Part of the air leaving the diffuser of the compressor by-passed the combustion chamber and rejoined the main stream just before admission to the turbine. The first engine of this design was known as the He.S.1. This was followed during the succeeding years by types He.S.2 and 3. In 1939 the He.S.3b had reached a sufficiently promising stage to warrant flight tests. The first flight was made in the Heinkel 178 experimental aircraft on Aug. 27, 1939. The engine developed a static thrust of 800 lb. for a specific weight of 1.00.

The promise of those early days was, for reasons probably connected with difficulties between the firm and the air ministry, not followed up. Heinkel acquired the control of Hirth-Motoren and during the next six years carried out at its factory a program of work which, although of interest to the development engineer, failed to produce effective aircraft engines. This development, which included a ducted fan engine, an engine with intermittent combustion and a ducted fan-piston engine combination,

culminated in 1945 with the He.S.11. In this engine the compressor consisted of an axial stage, followed by a centrifugal stage and three axial stages. The combustion system was straight through with downstream fuel injection. The turbine had two stages with hollow blades. The static thrust of the He.S.11 was 2,900 lb. for a specific weight of 0.72 and a specific fuel consumption of 1.30. At the end of World War II the engine had nearly reached the flight development stage.

As a contrast to Heinkel, which although first in the field yet failed to keep its lead by dissipating its development resources over too many projects, the Junkers company provided an example of a relatively rapid and concentrated development. After several years of tentative groping for the right starting point it was decided in 1989, probably after the Heinkel flight had shown the way, to start work on an axial jet propulsion engine. This engine, known as the Jumo oo4 A, had all the basic features of the later production engine. The eight-stage axial compressor was driven by a single-stage turbine and the combustion system was of the straight-through type with six chambers in parallel. Manufacture started early in 1940 and the engine ran for the first time toward the end of the year. The engine developed 1,800 lb. thrust with a specific weight of about 0.95 and a specific consumption of 1.5. The first flight was made in 1941, using an Me.110 as a flying test bed. A refined design, known as the Jumo 004 B. followed in 1942 and was flight-tested in the Me.262 in 1943. This engine developed 2,000 lb. thrust for a specific weight of 0.80 and a specific consumption of 1.4. The flight tests were satisfactory and plans for large'scale production were made. By the end of World War II about 5,000 engines had been completed. The Bayerische Motorwerke (B.M.W.) company started on jet propulsion engines in 1939 and produced the 003 engine. This was of the axial type with a seven-stage compressor, a single-stage turbine and an annular combustion chamber. The engine was generally considered to represent an improvement on the Jumo 004, but its development was not completed by the time the war came to an end.

Although the German jet propulsion engines were considerably inferior to contemporary British engines both in design and performance, it was to the credit of German engineers that they were the first to propel an aircraft by jet propulsion and the first to achieve large-scale production of jet propulsion engines and aircraft.

Thrust Boosting.—As the jet propulsion engine was in the first place developed primarily for fighter aircraft it was natural that the major emphasis should be placed on obtaining the greatest possible thrust for a given weight or size of engine. Considerable effort was therefore expended

Republic XP-84 Thunderjet which set an official U.S. speed record of 611 m.p.h. (unofficial 619 m.p.h.) during a test run in Sept. 1946. It was the first U.S. army jet fighter in that speed range

Jewels

Jewish Religious Life

in increasing the thrust by the refinement of detail design. In addition to this normal process of development special forms of thrust boosting were developed. The most important of these was the burning of additional fuel in the exhaust pipe after the turbine. This process, known as reheating, resulted in an increase in jet velocity and therefore in thrust but had to be paid for by a considerable increase in specific fuel consumption. The first experiments carried out in England in 1944 gave increases in thrust of 25%. The technique was later developed on the ground and in flight both in England and in the U.S. and increases of thrust of more than 30% were obtained. As the specific fuel consumption was about doubled when using reheat, this method of thrust boosting was suitable only

for short periods such as take-off and combat.

A considerable increase in thrust, particularly at low flight speeds, could be obtained by the use of a ducted fan. The ducted fan consisted essentially of a propeller of high solidity, enclosed within the duct formed by the engine cowling and driven by the main engine. There were numerous possible layouts for a ducted fan and several of these were tried without much success. The first attempt was probably that of Campini in Italy who drove his fan by a piston engine. A similar attempt was made in 1942 by the National Advisory Committee for Aeronautics in the U.S. and by Heinkel in Germany. In England Metropolitan-Vickers added a ducted fan to its F.2 engine in 1943 and Power Jets added one to its W/700 engine in 1946. Although the ducted fan gave improved thrust and economy at low speeds and, when fuel was burnt after the fan, an increase in thrust at the expense of economy at high speeds, its development was not carried out with enthusiasm because of the severe installation difficulties.

Outlook.—By the end of 1946 sufficient experience in the new means of jet propulsion had been obtained to justify firmer estimates as to its scope and limitations.

It was clear that the jet propulsion gas turbine engine represented a big advance over the piston engine in simplicity and lightness and had in addition many operating advantages; and, unlike the piston engine, there was no practical limit to the size in which it could be produced. On the other hand, it suffered from the serious disadvantage that its specific fuel consumption was excessive at low aircraft speed. It was essentially a power plant for high-speed aircraft. It was also realized that if long range were to be obtained, the aircraft must fly at a high level where both the economic cruising speed of the aircraft and the thermal efficiency of the engine were greatest. The jet propulsion engine was thus considered to be suitable for aircraft flying at more than 450 m.p.h. at altitudes of more than 30,000 ft. with low and intermediate ranges. It was also suitable for short-range high-speed interceptor fighters at all altitudes. While the operating advantages of simplicity, light weight, quietness and freedom from vibration were admitted, it was generally felt that its more general application had to wait several years before the development of cleaner aircraft made possible economic operation at high speeds. (For types of jet-propelled planes, see AVIATION, MILITARY; see also ROCKETS.) (H. CT.)

In the period 1937-46, the main influences affecting Jewish religious life were at first the dire propaganda and eventually the ruthless policy of extermination emanating from nazi Germany. In the German "master race" policy of annihilating Jews, Judaism early came under the ban. At the beginning of this decennium, before the nazis dared exercise unlimited conscienceless power, the attack on Jewish religious life in Germany took such forms as violating Jewish cemeteries, arresting rabbis, prohibiting the importation of kosher meat and liquidating smaller Jewish communities. But in a crescendo of diabolic horror, it rapidly moved on to the suppression of the Jewish press and publications, seizure of Jewish libraries, suppression of Talmudic academies, dynamiting synagogues, expropriation of Jewish religious institutions, confiscation of religious property, the arrest, torture, expulsion or murder of rabbis and religious teachers, dissolution of all Jewish communities and communal committees and organizations and in the end the annihilation of German Jewry through extermination in gas chambers.

This total warfare was waged also through a vast network of obscene anti-Semitic propaganda which was also exported far and wide beyond the borders of Germany. As Hitler's troops marched into the neighbouring countries of Austria, Czechoslovakia, Poland and the other lands of continental Europe, the German occupation authorities relentlessly put into effect the policies of extermination of Jews and Judaism which they had so efficiently worked out in Germany. Sometimes, as in Poland, they found the soil well prepared and saturated with native anti-Semitism. There no limits were set to their inhumanities, with the result that the 3,500,000 Jews of Poland of 1937 were reduced to some 80,000 at the end of the decade. Most of these were survivors of concentration camps, rescued only because the German authorities in the last days of losing World War II did not have time to "liquidate" all the Jews remaining in their hands. The virtual extinction of Jewry in Poland meant the obliteration of the most intensive centre of Talmudic religious study and living, for in prewar Poland were found the world's greatest Talmudic academies (Yeshivoth). With rare exceptions of individual rabbis and students who were able to escape through Siberia and the far east, the Polish Yeshivah scholars of Jewish religious tradition had been done to death and their seminaries destroyed beyond all hope of reconstruction in eastern Europe.

In lands such as the Netherlands, Italy or France, where German anti-Semitism met resistance on the part of the general population, the pace of obliteration of Judaism was slowed down in the hope of not intensifying the antagonism of the peoples of these occupied lands. In such countries, not all synagogues were automatically destroyed; but as the years rolled on, the Germans seized more and more of the Jewish population and sent them to destruction in murder camps.

From this general picture of destruction of Jewish religious life in continental Europe, only the Iberian peninsula in the west, Sweden in the north, Switzerland in the centre and Russia in the east, stood out. In Franco's Spain restrictions were placed on Jewish religious life. In the small communities of Portugal, Sweden and Switzerland, Jewish life developed to some extent through the influx

of refugees. In Russia a marked changed was recorded. At the beginning of the decade, all Russia was still in the grip of a government-sponsored militant anti-God propaganda and policy. Russian Jews were prohibited from giving their children Hebrew instruction and all religious education was barred. Synagogue buildings were transformed into communist clubs, and such Jewish religious life as persisted had gone underground. But early in the 1940s this policy began to be relaxed. The ban on public worship was mitigated, and synagogue services were tacitly or even explicitly allowed. However, the younger Jews who had grown up during a generation of militant atheism were largely lost to Jewish religious life, and among the 3,000,000 or more Jews of the soviet union Judaism survived pallidly and anaemically, without prestige in the older generation of grandparents.

Among the Jews who survived the cataclysm of continental Europe, Judaism was very sorely beset. While all Europe was grubbing among the ruins of its prewar economy, its Jews were sunk in the most abject poverty. Their communal property had been largely destroyed, and the personal property seized from them had rarely been restored. Thus, of the 180,000 Jews remaining in Hungary, no less than 120,000 were on relief. In such conditions the reconstruction of Jewish religious life became superlatively difficult. No religious teachers, cantors or rabbis were trained during the years of war, and there was an overwhelming lack of these functionaries, as well as of prayer books, Hebrew Bibles, religious text books and Hebrew books generally. Therefore, even though small Jewish communities should eventually be able to reconstitute themselves in what were some of the great centres of Jewish religious life in continental Europe, the immediate outlook for a strong and fruitful Judaism was dark

A further complicating factor was presented by the emotional outlook of the survivors. In many cases their years lived under fear of impending destruction, their despair of human goodness and the extreme of suffering endured had left them with the feeling that their prayers and their God failed them. These men had lost all faith in a religious concept of life. Others had accepted baptism in an attempt to escape from a religion that had drawn on them intolerable persecution. In other cases the dislocation of Jewish life through the destruction of synagogues, the murder of rabbis and the dissolution of Jewish communities

Anti-Jewish sign painted by quislings on a Norwegian shop window during the German occupation: "Palestine calling. Jews not tolerated in Norway"

had habituated the surviving Jews to a life without the forms and rituals of Judaism. In still other cases, in escape from the atrocities of the world, the swing had been to an extreme intensity of Jewish living. In very many cases, especially among the hapless displaced persons, the blood-soaked streets of their former homes in Europe and the meaningless cruelty of the unending camps for displaced persons made them utterly despair of Europe and seek a new field for Jewish life in Palestine. In a word, it was difficult to find in postwar continental Europe the simple, natural, balanced and happy Jewish religious life which marked so much of European Jewry in pre-nazi days.

During the decade, hundreds of thousands of Jewish refugees cluttered the highways and secret coverts of the whole world. Government action, beginning with the intergovernmental conference at Evian les Bains, successively postponed real action. Many of the refugees brought a certain increase of vigour to the religious life not only of the neutral countries of Europe, but also throughout Latin America and other countries which escaped occupation by the axis powers. New Jewish communities of this character grew up in such remote places as Salisbury, Rhodesia, or Tanganyika.

Outside of Europe, Judaism did not find a favourable attitude for development in Perón's Argentine republic and other lands into which the virus of anti-Semitic propaganda had been sedulously pumped by the nazis. Even in the U.S., forces of extreme reaction and illiberalism were sometimes financed and given leadership from German sources. Here and there swastika signs were daubed on synagogues, and, closely following the German model. tombstones were overthrown in Jewish cemeteries. But against such irresponsible hoodlumism, the voice of the U.S. spoke out strongly and clearly, with only feeble discordant overtones from the press of professional anti-Semites. Such threats to Jewish religious life were more than counterbalanced by the growth of interfaith goodwill. Enlightened religious leaders, recognizing that the virulence of German anti-Semitism was threatening to become pandemic, saw the necessity of strengthening organized religious interdenominational goodwill, and over the radio, in the press and through public meetings and striking joint pronouncements by Catholic, Protestant and Jewish religious spokesmen, the common basis of Judaism and Christianity and positive co-operation between Christian and Jew were held up as the true expression of the free democratic spirit.

The armies of the United Nations also served as a laboratory for distilling good interfaith relationships. In all these armies, Jews necessarily were present as a small minority. It was impossible to appoint enough Jewish chaplains to serve the Jews found in thousands of posts and on innumerable transports and warships throughout the world. The 311 Jewish chaplains in the U.S. army, navy and air force were able to care for the religious needs of the larger concentrations of U.S. Jewish uniformed men. But all over the world scattered Jews in the battle lines found their distinctive religious services organized, supervised and sometimes actually conducted by Christian chaplains. Gentile and Jew served, laboured, faced danger and gave their lives together in a flaming experience of intimate comradeship that revealed the oneness of their humanity and of their fundamental faith. Foxhole religion knew no denominationalism. But how much of this greater sensitivity to religion aroused by the experiences of war would be carried over into civilian life was not yet clear at the decade's end.

In two countries of the world Judaism grew strikingly in importance and vigour during this period-the United

Open air services for a Jewish congregation in the bombed ruins of the Aldgate synagogue in London during 1941

States of America and Palestine. Something of the religious fervour and Jewish scholarship of continental Europe found a new home in the U.S. through the forced emigres who found refuge there. By 1946, the world's greatest Jewish libraries and institutions of Jewish learning were to be found in the U.S. U.S. Judaism in 1946 was stronger than it was in 1937, both absolutely and also relatively in the light of the ruin or complete destruction of the great centres of Judaism on continental Europe.

In Palestine the strength of Judaism grew in this period by leaps and bounds. Notwithstanding Great Britain's policies, Jewish immigration swept on into the Holy Land openly and under cover, bringing new strength to the Hebrew university, to the Palestine rabbinate, to the Talmudic academies and the other Palestinian institutions of Jewish religious life and culture. During this period Palestine produced a notable outpouring of Hebrew literature. At the same time the ten-volume Universal Jewish Encyclopedia was completed in the U.S.

To sum up, the decennium brought destruction to Jewish life in most of Europe and the scattering of its surviving Jews to the four winds. Jewish religious life survived with vigour mainly in the U.S., the British empire and Palestine. (See also Anti-Semitism.)

BIBLIOGRAPHY.—American Jewish Year Book (1937-46) (D. de S. P.)

Jewish Welfare Board, National

Expansion of services to the U.S. armed forces and to the Jewish community centres of the United States, accompanied by far-reaching organizational, fiscal and programmatic changes, characterized the work of the National Jewish Welfare board (J.W.B.) in the decade 1937–46.¹ The decade saw Jewish centre membership rise to 427,000. Simultaneously, the number of national Jewish organizations affiliated with J.W.B. increased to 38 and J.W.B. sections, composed of regional groupings of centres, grew in number to 9. All these gains were accompanied by a rise in volunteer workers to 40,000.

In an era of global struggle, economic and social dislocation and postwar readjustment for millions of veterans and youth, J.W.B. launched new religious, cultural, social and educational services. These included a vast expansion of service to the armed forces; personnel training for centre professional workers through institutes and seminars; stimulation of local and regional youth councils; vocational guidance and veterans' aid programs; work with women and girls (through the U.S.O. and Jewish Center Committee on Women and Girls); published program aids; and recreational and cultural programs for rural communities.

World War II and the ensuing expansion of services and programs on a world-wide basis were accompanied by fundamental changes in the fiscal and organizational structure of J.W.B. Participation in J.W.B. was broadened by enlarging the national council to 517 members representing the local centres as well as national affiliates and regional sections; a national board of directors replaced the smaller executive committee, and gave direct representation to the J.W.B. constituent organizations; and a national finance council, composed of representatives of 35 different communities with a national plan for meeting the budget on a basis of quotas assigned to 700 local communities, was established. A major change in national leadership occurred when Judge Irving Lehman, president for 19 years, was succeeded by Frank L. Weil in 1940, while Harry L. Glucksman, executive director from 1919 until his death in 1938, was succeeded by Louis Kraft.

As U.S. Jewry's united instrumentality for serving the religious and welfare needs of Jews in the armed forces, J.W.B. had been ministering to their needs with government authorization since 1917. Between the two world wars, J.W.B. continued to serve at all military installations, and in World War II it expanded its machinery for caring for the spiritual needs of 600,000 Jewish men and women in the service.

At the core of the structure of service were the Jewish chaplains. These rabbis, whose congregants were G.I.s in battle dress, were recruited from civilian life by J.W.B.'s Committee on Army and Navy Religious Activities (C.A.N.R.A.), on which were represented rabbis from the reform, orthodox and conservative sections of the rabbinate in equal numbers. By Jan. 1, 1941, the committee had granted ecclesiastical endorsement to 15 chaplains. In the course of the war, 311 were endorsed, and on V-J day 288 were in service.

¹ The J.W.B. was authorized by the U.S. government to serve the religious, spiritual and morale needs of Jewish men and women in the armed forces, besides being the national association of Y.M.H.A.s, Y.W.H.A.s and kindred organizations representing 288 Jewish community centres and Y.M. and Y.W.H.A.s in the United States and Canada.

Chaplains were on duty wherever U.S. troops served. Jewish chaplains were aided in their work in Germany, France and China by a staff of J.W.B. workers stationed in Heidelberg, Paris, Reims, Frankfurt, Bremen and Shanghai, who established religious hospitality centres for Jewish men following V-J day.

Religious supplies from J.W.B.'s network of regional depots reached every corner of the globe. Regional supply depots in the United Kingdom, the European and Mediterranean theatres, India and Hawaii facilitated their dispatch. From 1941 to early 1942, J.W.B. distributed 135,000 army and navy prayer books and Bibles. In 1944, it distributed 193,700 prayer books and 1,257,643 Jewish calendars, in addition to 50,000 haggadahs and more than 550,000 mezuzzahs. All told, J.W.B. published and distributed more than 6,000,000 books and pamphlets for Jewish men besides supplying 600,000 pounds of matzoth, 13,000 gallons of Passover wine and 20,000 prayer shawls. Some notion of the magnitude of J.W.B.'s religious service may be gathered from a comparison of 1936 with 1943; 2,414 Jewish men were served at the high holy days in the United States and abroad in 1936; in 1943, 355,000 attended 2,579 services.

With the advent of World War II, it became necessary to provide war service for the armed forces and a new agency, U.S.O., was created representing the citizens of the United States by a group of the large national welfare organizations, Y.M.C.A., Y.W.C.A., National Catholic Community service, Salvation army, National Travelers Aid association and the National Jewish Welfare board. J.W.B. served through the channel of U.S.O., of which it became a member agency, in the greatest interfaith experiment in U.S. history. In U.S.O., J.W.B. served the total war effort and at the same time helped meet the special needs of Jews. J.W.B. became active at the start in 89 U.S.O. clubs, and at the peak of U.S.O. service operated 225 of them. In 1946, it had 681 army and navy committees all over the world-in 1941, 193. The army and navy staff grew from 44 in Jan. 1940, to 590 in October 1945. J.W.B. served at all points in the United States and at U.S.O.'s overseas offshore points: Panama Canal Zone, Hawaii, Trinidad, Puerto Rico, Alaska, Philippines and Bermuda. In 1939, the board erected a permanent building at Balboa in the Canal Zone on land furnished by the armed forces, and in 1945 the board acquired by purchase a building in Honolulu, Hawaii. Both of these buildings were operated for the benefit of the armed forces, and the building in Honolulu was adapted also for use as a Jewish community

To compile the record of Jewish participation in the war, J.W.B., through its Bureau of War Records, carried out the mandate of the U.S. Jewish community to collect and preserve the facts of Jewish participation and achievement in the war. The bureau conducted the work of research and identification of Jews in the service, with a professional staff and 1,003 volunteer war record committees and correspondents, including 12 state committees (1946).

Serving patients at army and navy hospitals after 1917, J.W.B. met the special spiritual and welfare needs of Jewish men at 101 army general, navy general and seven naval convalescent hospitals in 1943. In 1945, its staff of 92 U.S.O.-J.W.B. workers, chaplains and rabbis served at 155 army and navy general convalescent and regional hospitals. These had the aid of 65 volunteer committees.

J.W.B. had been accredited since 1925 by the Veterans'

administration to handle claims for disabled veterans. In addition, it offered "spiritual therapy" to the hospitalized veterans in the form of religious ministration, personal counselling and spiritual and morale services. In 1946, it was serving the needs of veterans of both wars at 87 of the 97 veterans' hospitals through civilian rabbis, lay workers and chaplains. Other hospitals were served by J.W.B. representatives or lay co-workers in the community. Under J.W.B. guidance, 80 cities had organized committees to aid veterans to find their way back to civilian life.

In 1943, J.W.B. reached an agreement with the Jewish War Veterans to join efforts in order to eliminate duplication in the aid to veterans seeking benefits for disabilities. A field staff of 17 trained workers in the principal areas of the country aided veterans to secure pensions, vocational rehabilitation and other benefits of the G.I. Bill of Rights. By the end of 1946, about 2,000 contacts a month were being made by individuals for this assistance; in 1941 the board had handled a total of 10,476 personal welfare cases, government claims of disabled veterans, dependents and beneficiaries. In 1945, 5,176 claims for pensions were handled by J.W.B. field staff. In the first 6 months of 1946, 15,070 veterans contacted the board for a total of 7,952 claims.

The needs of servicemen in isolated areas which U.S.O. could not easily reach, and which were far from communities having a Jewish population, led to the formation in 1942 of the J.W.B. women's division, a coalition of nine national affiliated Jewish women's organizations representing 250,000 volunteers in 43 cities. In 1943, 34 cities were serving 40 camps and areas through the women's division. In 1945, 125 military installations were served through its projects, which included "Serve-A-Camp"; "Serve-A-Chaplain"; "Serve-A-Hospital" and "Serve-A-Hospitality Center" (overseas). A total of 102 communities were organized and served 177 areas. Besides the "Serve-A" projects, the women's division was responsible for the dispatch of 1,125,-300 gifts, sent in response to requests, for religious holiday use.

J.W.B.'s role in the war effort paralleled its welfare and educational activity on behalf of Jewish youth in 288 Jewish community centres. As the national association of Jewish community centres, Y.M.H.A.s, Y.W.H.A.s and similar groups in the United States and Canada, with a total membership of 427,000 men and women, young people and children, J.W.B. assisted these local groups to plan programs of recreational and educational activity and Jewish culture for their membership.

Under J.W.B. guidance, Jewish centre membership grew from 370,000 in 1937 to 427,000 in 1945. Attendance at Jewish centres in 1945 approximated 25,000,000 boys and girls, men and women. In 1937, the Jewish Center Lecture bureau of J.W.B. gave 911 services to 425 organizations. In 1945, it made 1,153 bookings. The J.W.B. staff made 1,252 visits to 183 communities in 1937, while in 1945, the staff made 1,500 visits to 200 communities, with 300 organizations receiving service.

Concern with the problems raised by the entry of youth into war jobs led the J.W.B. to set up in 1945 a Department of Youth Service. J.W.B. became a member of A.Y.S.O. (Associated Youth Serving organizations) and of the youth division of the National Social Welfare assembly. Under J.W.B. leadership, Jewish centre professional staffs grew from 1,000 in 1936 to 1,250 in 1946. The cost of Jewish centre buildings increased to \$40,000,000 from \$35,000,000 in 1937. In 1943, J.W.B. became sponsor-coordinator of the Jewish Book council and in 1945 of the Jewish Music week project. During the war years, J.W.B.

encouraged centres to serve the war effort through day care of children, first aid and nutrition programs, air raid protection, scrap collections, war bond purchases and many other war-supporting activities.

The 29th annual convention in May 1946, the first in 4 years, was attended by delegates from 38 states who witnessed the bestowal of an award on J.W.B. "for unique and outstanding service" by the war and navy departments. In addition, they heard a message from President Truman who commended J.W.B. for its "world-wide program of services and activities on behalf of the welfare, religious and morale needs of men and women in the service," which "contributed substantially to victory."

(F. L. W.)

Jews, Distribution of

The most significant fact in the population distribution of Jews during World War II and in the years immediately preceding and following, was the diminution of their total number throughout the world, from roughly 16,000,000 in 1937, to something between 11,000,000 and 12,000,000 at the end of 1946. The "Judenrein" policy of Germany's National Socialist party was the primary cause for this loss of numbers. As the German armies moved across Europe, citizens of Jewish faith of the occupied countries were singled out for destruction. In lesser degrees, the satellite nations under the influence of Hitler adopted stringent anti-Semitic policies. While such policies were not always so explicitly designed for the liquidation of Jews as in Germany itself, they nevertheless achieved similar results.

The greatest change in the distribution of Jews therefore, occurred in those places where nazi control endured longest and with the most direct authority; in central and eastern Europe. This area, in prewar years, contained some of the most densely-populated Jewish areas in the world, as follows: Austria, 190,000; Bulgaria, 48,398; Czechoslovakia, 356,830; Germany, 240,000; Hungary, 440,567; Latvia, 93,479; Lithuania, 155,125; Poland, 3,113,900; Rumania, 900,000, and Yugoslavia, 68,405. In 1937, approximately one-third of the world's population of Jews, therefore, lived between the Rhine and the soviet frontiers.

Other large centres of Jewish population in that year were: France, 240,000; Great Britain and Northern Ireland, 300,000; Palestine, 424,373; U.S.S.R., 3,020,141; United States, 4,770,000. The rest of the nearly 16,000,000 Jews were residents in, or citizens of, some 80 countries or territories, from Tanganyika with a known population of 10 Jews to Argentina with some 260,000.

The impact of national socialism may best be gauged by a comparison of these figures with the most reliable figures obtainable some 14 months after the end of World War II. The appendices to the Report of the Anglo-American Committee of Inquiry showed the following estimated postwar populations, in the winter of 1946:

		V -
Austria	45,000	Hungary 200,000 U.S.S.R. 2,500,000 (including Estonia, Latvia and Lithuania)
Silesia and Slovakia)		Poland 80,000
Germany	20,000	Rumania 335,000
(not including wards		Yugoslavia 11,000
of occupying powers		•
in displaced persons		

A decade of enforced migration, by those fortunate enough to escape, brought about these reductions. More than 1,000,000 Jews were known to have escaped nazidominated Europe, and no record of population of Jews

camps)

for this period would be complete without some notice of the phenomenon of "refugeeism." The principal havens and approximate numbers who reached them were as follows: U.S.S.R. (beyond the Curzon line), 350,000; Palestine, 250,000; United States, 200,000; Latin America, 120,000; Great Britain, 60,000; Switzerland, 31,000; other countries, 50,000.

The redistribution by migration had not yet halted by the summer of 1946. The Anglo-American Committee of Inquiry reported that 500,000 Europeans of Jewish faith would have to, or wished to, leave Europe. Most of them were originally from central and eastern Europe. At the time of the committee's investigation, about 140,000 of this 500,000 were in displaced persons camps. The rest were a part of some 800,000 Europeans, living as refugees in countries other than their native lands, unwilling or unable to return to their homes. In addition there were 5,000,000 Jews in the United States; 300,000 in England; 160,000 in France and 25,000 in Belgium. Holland's prewar population of Jews had shrunk to 25,000. Palestine's Jewish population meanwhile had increased to some 650,000

Certain trends were discernible. The centre of gravity of Jewish population had shifted from the heart of the European continent. The flow of population was in two directions; westward to the United States and eastward to Palestine. (See also Anti-Semitism.) (El. Br.)

Jinnah, Mohammed Ali

), Indian lawyer and politician, was Jinnah (1876educated at Karachi, India, and in Great Britain. He served on the Imperial Legislative council from 1910 to 1919 and in 1916 was named permanent president of the Moslem league. During World War I, Jinnah urged Moslem-Hindu unity and persuaded the Congress party and Moslem league to hold joint sessions. But after the spectacular victories of the Congress party in the elections of 1936-37, the Moslem league became fearful of Hindu predominance in the government, and Jinnah's policy became increasingly hostile to the Congress party. The suspicion of Hindu domination was also responsible for Jinnah's willingness to accept the British White Paper of 1939, which deferred the question of India's independence until after the close of World War II. In 1940 Jinnah and the Moslem league formulated their demands in terms of "Pakistan," the existence of a separate Moslem state. When the British released their plan for an independent India in May 1946, Jinnah expressed dissatisfaction, and the Moslem league, as well as the Congress party, rejected the plan.

Jitterbug See Dance.

Jodl, Alfred

Jodl (1892?-1946), German army officer, served with the Bavarian army in World War I. After the armistice in 1918, he was attached to the ministry of war and later to the German intelligence service. Jodl had advanced to the rank of major general by 1939, and was a colonel general throughout most of World War II. In late 1940,

when Franz von Halder opposed a German attack on the soviet union, Jodl replaced him, first as Hitler's chief military adviser and then as chief of staff. Jodl headed the German delegation that signed the German surrender at Gen. Dwight Eisenhower's headquarters in Reims, France, on May 7, 1945. Indicted as a war criminal, Jodl went on trial with a score of other high-ranking Germans at Nuernberg in Nov. 1945. He was sentenced to death at the conclusion of the war crimes trial and hanged with nine others in the Nuernberg jail yard Oct. 16, 1946.

Johannesburg

City of the Transvaal province of the Union of South Africa, Johannesburg continued its rapid industrial expansion throughout 1937-46. Its prosperity and growing importance had made it the chosen site of the Empire exhibition which came to an end in Jan. 1937, and in 1940 gold mining in the area had been so productive that the Transvaal was recognized as the world's leading gold centre, supplying 34.7% of world production. Gold production in 1945 reached the high figure of 12,213,545 fine oz., valued at more than £100,000,000. It was believed that discoveries of gold in the Odendaalsrust area of the Orange Free State would oust Johannesburg from its place as the centre of gold production in the union, but other industries growing up and thriving there would maintain its reputation as a rich and spreading city. The population figure for 1946 was 750,000, an advance of 230,616 on the census figure for 1936.

World War II had little effect on its industries, but preparations were made for an air raid precaution scheme that was never forced into action. The independent views of the mining population were emphasized by the crises of war, and on Jan. 31 and Feb. 1, 1941, serious riots broke out between soldiers on leave and members of the Ossewabrandwag.

Johnson, Hugh Samuel

Johnson (1882-1942), U.S. soldier and government official, was born Aug. 5, 1882, in Fort Scott, Kan. He joined the army when he was 15, and later entered the U.S. military academy, from which he was graduated in 1903. He served in the Philippines, 1907-09. On returning to the United States, he studied law and was judge advocate with Pershing's forces during the Mexican campaign of 1916. During World War I, he helped organize and establish the machinery for the draft law and also served on the war industries board. A brigadier general when the war ended, he resigned in 1919 to enter private business. He was president of an automobile carpet company in 1933, when President Roosevelt called him to administer the National Industrial Recovery act. Gen. Johnson was given wide authority to operate the machinery intended to guide business in the national recovery program. He resigned a little over a year later when the NRA was reorganized. He then became a newspaper columnist for the Scripps-Howard chain and displayed the talent for blunt language and colourful invective that earned him the nickname of "Old Ironpants." At first, Johnson defended the New Deal against the "tories." Later, he bitterly attacked the Roosevelt administration and its "radical" trend. Johnson died in Washington, D.C., April 15, 1942.

Johnston, Eric A.

Johnston (1896-), U.S. industrialist, was born

Dec. 21, 1896, in Washington, D.C. He graduated from the University of Washington, Seattle, Wash., in 1917 with a bachelor's degree in law and served as captain in the marine corps from 1917 to 1922, when he returned to Spokane. After a number of years as a successful business executive, he was elected president of the Chamber of Commerce of the U.S. in 1942. In Feb. and March 1943, in his role as chairman of the U.S. Commission of Inter-American Development, Johnston toured through seven countries of South America, conferring with government leaders and businessmen on plans for postwar economic co-operation. He visited England in August of that year and urged that postwar world trade be based to the maximum extent on free competitive enterprise. In the summer of 1944 he spent six weeks in the soviet union to explore postwar trade possibilities; he wrote a number of articles on his impressions of the U.S.S.R., expressing his optimism regarding postwar trade relations with the United States. In addition to his chamber of commerce position, where he was regarded as representative of the more liberal and progressive industrialists, Johnston was a member of the Economic Stabilization board and of the Economic Advisory committee of the state department and a trustee of the Committee for Economic Development. In March 1945, Johnston, together with A.F. of L. and C.I.O. leaders, signed the business-labour postwar peace charter, outlining principles designed to establish postwar industrial harmony and providing for social security and the arbitration of industrial disputes. On Sept. 19, 1945, Johnston resigned his post as president of the chamber of commerce to become president of the Motion Picture Producers and Distributors of America.

Jones, Jesse Holman

Jones (1874-), U.S. business executive and government official, was born in Robertson county, Tenn., on April 5, 1874. Prior to his career in government, he engaged in extensive industrial, financial and real estate operations in Texas and bought control of the Houston Chronicle, of which he became publisher. President Hoover appointed him a director of the Reconstruction Finance corporation in 1932, and he became chairman the following year. In July 1939 Jones was appointed administrator of the Federal Loan agency. In addition to this office, he was named secretary of commerce on Sept. 13. 1940, to succeed Harry L. Hopkins. Jones came under fire in 1942 when the Truman committee of the senate blamed him for much of the rubber shortage, charging that he had overruled proposals to expand the production of synthetic rubber. He was again attacked, in June 1943, by Vice-President Henry A. Wallace, chairman of the Board of Economic Warfare, for alleged failures to supply funds to acquire critical materials. During the acrimonious pubItc dispute that followed, President Roosevelt eliminated the Board of Economic Warfare and rebuked both Wallace and Jones. But the fundamental difference in policy represented by Wallace, an advanced New Dealer, and Jones, an essentially conservative financier and businessman, persisted. On Jan. 21, 1945, Jones acceded to the president's request that he resign from his posts in favour of Wallace. Although Wallace became secretary of commerce, he was not confirmed by the senate for the Federal Loan agency position; Fred M. Vinson succeeded Jones in the latter post.

Jones, Marvin

Jones (1886-), U.S. jurist and politician, was born near Valley View, in Cooke county, Tex., Feb. 26, 1886. He was graduated from Southwestern university, Georgetown, Tex., in 1905, received his law degree from the University of Texas, Austin, Tex., and was admitted to the Texas bar in 1907. He established a private practice of law in Amarillo, Tex., and in 1913 was appointed chairman of the board of legal examiners in the 7th supreme judicial district of Texas. In 1917 Jones was elected to the house of representatives, where he served continuously for 24 years. As chairman of the house committee on agriculture, he sponsored much of the New Deal farm legislation; he helped draft the Agricultural Adjustment act and, when that was declared unconstitutional, wrote the compromise Soil Conservation act. On Nov. 20, 1940, he resigned from the house to accept an appointment as judge of the U.S. court of claims. During World War II Jones acted as principal adviser on food problems to the director of economic stabilization, James F. Byrnes, and served as conference president and chairman of the U.S. delegation to the United Nations conference on food and agriculture at Hot Springs, Va., in 1943. Named head of the war food administration on June 28, 1943, to succeed Chester C. Davis, he pursued a policy of maintaining prices by means of government subsidies. On July 1, 1945, Jones resigned to resume his duties as judge of the court of

Jong, Jan de

Cardinal de Jong (1885-), archbishop of Utrecht, was born at Nes, off the shore of the province of Friesland, Holland, on Sept. 10, 1885. Ordained in 1908, he later studied theology in Rome and was professor of history in the major seminary of Ryzenburg, Holland. Named auxiliary bishop of Utrecht on Aug. 3, 1935, he became ordinary of that see the following year. Archbishop de Jong took a bold stand against co-operation with the nazis during the occupation of The Netherlands in World War II. He refused to allow church services to be broadcast over German-controlled radio stations, denied the right of attendance at Catholic schools to storm troopers, and refused the sacraments of the church to any member of a Dutch nazi-controlled party. Archbishop de Jong was proclaimed cardinal by Pope Pius XII on Feb. 18, 1946, although he was unable to be present at the consistory in Rome.

Jordana y Souza, Francisco Gómez

Jordana (1876–1944), Spanish army officer and politician, received his education at the Spanish Military academy and Staff college. He saw service in Cuba early in his career, and in 1903 was attached to the general staff. Later he became an instructor of the Escuela Superior de Guerra. Promoted to the rank of brigadier general in 1920, he was placed in charge of Moroccan affairs in the

Primo de Rivera government. In 1928, with the rank of lieutenant general, he was appointed high commissioner of Morocco. Jordana supported the 1936 uprising against the Spanish republican government and subsequently held a number of important posts in the Franco dictatorship. Vice-president and minister of foreign affairs in 1938, he became president of the council of state the following year. He held this post until Sept. 3, 1942, when he again became foreign minister, succeeding Franco's brother-inlaw, Ramón Serrano y Suñer. Mildly pro-German during the period of axis victories, he watered down this attitude during the decline of German power beginning in 1943. He then strove to ease Spain away from its embarrassing pro-German foreign policy and adhered cautiously to what was described as "strict" neutrality. He died in San Sebastian, Aug. 3, 1944.

Jowitt of Stevenage, Viscount

Viscount Jowitt, (Wılliam Allen Jowitt) (1885—), was educated at Oxford university and was admitted to the bar in 1909. A gifted orator, he prospeted as a barrister; he figured as counsel in many notable cases, including that of Princess Irina Youssoupoff, who opened a libel suit against the British film company that produced the moving picture Rasputin, and in the duke of Windsor's libel suit against the publishers and author of Coronation Commentary.

Entering politics, he joined the Liberal party and in 1922 he was elected as Liberal M.P. for the Hartlepools. He was knighted in 1929 and in May of that year was elected Liberal M.P. for Preston. Experiencing a change of conviction later, he joined the Labour party the following month. Jowitt, who was attorney general from 1929 to 1932, was later expelled from the Labour party for supporting Ramsay MacDonald's national government; but in 1936 he was reinstated; in 1939, he was returned to parliament, again as Labour member, from his constituency in Ashton-under-Lyne.

Named solicitor general in 1940, he held this post until 1942 and was minister without portfolio in the Churchill coalition government, 1943–44. In 1944, he was appointed minister of National Insurance, serving until 1945. On July 27, 1945, Attlee named Jowitt lord chancellor in the new Labour government. He was raised to the peerage in 1945 as Baron Jowitt of Stevenage; in Dec. 1946 he was created viscount.

Judiciary, British

World War II produced a number of modifications in the form of the British judiciary which though sweeping in theory were of little practical importance. An emergency system was provided by acts of parliament under which the lord chancellor was empowered to vary the locations and jurisdictions of English and Welsh courts, and to set up special new courts if necessary; these plans were never carried out, for they were intended for use in the event of a partially successful invasion of Great Britain. Similar powers were authorized in Scotland where they were to be used by the lord president of the court of session in respect of that order, and by the lord justice general in respect of the high court of judiciary. The only wartime measures actually carried out were the reduction in the number of jurors in a jury from 12 to 7, and, in civil

cases only, the abolition of juries except when specially ordered by a judge in a particular case.

Permanent alterations in the form of the judiciary were also enacted and carried into effect. Justices of the peace were put by the lord chancellor on special supplemental lists as soon as they were considered too old (or otherwise unfit) to officiate in court; they were then invested with all the powers and rights of justices of the peace (such as conducting county business and signing warrants) except that of sitting in court and giving judicial decisions. At quarter sessions legally qualified and salaried chairmen and deputy chairmen were appointed whenever a quarter sessions meeting requested the lord chancellor to do so; this began to be a regular practice. When such chairmen or deputy chairmen presided, the jurisdiction was enlarged and many new types of cases, previously triable only at assizes or in London, could be tried at quarter sessions. Juvenile courts, composed of specially selected justices of the peace nearly always including a woman (or in London, of such justices with or without a metropolitan magistrate), were given powers to deal specially with children and young persons so as to conduct proceedings in a less formal and frightening atmosphere (not in the usual courthouses) and to correct and reform rather than to punish. County court judges' jurisdiction was extended to matters affecting up to f_{200} in value arising out of contracts, where the sum had previously been only £100 or less; this seemingly small alteration greatly increased the scope of county courts. All county court judges were also, in 1946, made divorce commissioners, with powers of divorce judges of the high court, and were expected to exercise this jurisdiction about twice a month and so deal with many simpler divorce cases locally. The ancient court of the mayor and City of London was enabled to act in two ways, either on the basis of high court procedure (when appeals went to the court of appeal) or less formally (and more expeditiously) on the basis of county court procedure when appeals went to the high court. In the high court of justice itself, alterations were made to the number of judges in each division, which became: in the chancery division not less than 5; in the King's bench division not less than 17 and in the probate divorce and admiralty division not less than 3. A total of not less than 25 judges had to be in office at once and the lord chancellor might appoint up to 32 if business was sufficient to occupy them, as it was throughout the postwar period. Another high court development was the transfer of judges from one division to another, which became possible under an act, so long as the residents of the divisions concerned (the lord chancellor, the lord chief justice and the president of the probate divorce and admiralty division respectively) and the judge concerned agreed; the lord chancellor had to consent in all cases of judges' transfers even if his division were not affected. In addition, larger numbers of special commissioners were appointed with powers of judges of the high court both on assize in the country in King's bench division (including criminal) cases and for divorce only in London.

These permanent developments were aimed successfully at restricting the powers of justices who had no legal qualifications or were physically unfit (except in juvenile cases where their jurisdiction and powers were extended), at extending the jurisdiction of legally qualified justices and judges and at expediting the hearing of cases both in general for the future and in particular in respect of the accumulated aggregation of matters which had been put

aside during, and because of, World War II. This expedition was largely effected by the untiring and skilful administrative perseverance of two outstanding judicial personalities, Lord William Allen Jowitt and Lord Rayner Goddard (both appointed in 1945), in their official capacities as lord chancellor of Great Britain and lord chief justice of England respectively.

In addition to the truly judicial tribunals a number of quasi-judicial tribunals were established (such as the rent tribunals for furnished lettings, the pensions appeals tribunal and the civil reinstatement tribunal) with exclusive jurisdiction under certain acts in special spheres and with no appeal from them to higher courts; these tribunals were not necessarily (nor usually) presided over by a legally qualified person, did not make use of legal procedure but replaced the ordinary courts in respect only of the matters assigned to them.

While they were undoubtedly successful in dealing quickly and on the whole fairly with a large volume of cases, they were inclined to appear arbitrary and unpredictable in their decisions, which might vary greatly from place to place since there was not such a common bond of outlook, training, or experience between their chairmen and members as existed, for example, among the county court judges.

Juin, Alphonse Pierre

Juin (1888?-), French army officer, was born in Bone, Algeria, and was educated at St. Cyr, French military academy. During World War I he served as captain with Moroccan forces, and later became chief of staff to Marshal Lyautey. A divisional commander during the battle of France in June 1940, he was taken prisoner by the nazis and was released a year later. There were indications that Pierre Laval had arranged for Juin's release in order to have him supplant Gen. Maxime Weygand as French proconsul in Africa. On Nov. 20, 1941, Juin succeeded Weygand as commander in chief of French forces in North Africa. At the time of the Allied landings in Morocco and Algeria in Nov. 1942, Juin and Admiral Jean Darlan agreed to surrender Algiers after only 16 hours of hostilities. Captured by the Allies, Juin carried on negotiations with them and concluded an armistice, acting under Darlan's authority. After the latter's assassination, Juin was reappointed commander in chief of French forces in North Africa on Dec. 29, 1942. Although he was then unpopular with the Gaullists, the French Committee of National Liberation approved the appointment. Juin led French armies in Tunisia and on the Italian front in Dec. 1943, and was named chief of the general staff for national defense in Aug. 1944.

In June 1945 he was designated resident general of $^{\circ}$ Morocco.

Juliana

Princess Juliana of the Netherlands and Lippe-Biesterfeld (1909—), was born at The Hague on April 30, 1909, the only child of Queen Wilhelmina and her consort, Henry, Duke of Mecklenburg (d. 1934). She was educated at the University of Leyden, and from an early age enjoyed popularity throughout the country. On Jan. 7, 1937, she was married to Prince Bernhard Leopold of

Lippe-Biesterfeld (born at Jena, June 29, 1911), son of Prince Bernhard Casimir (d. 1934). On Jan. 31, 1938, Princess Juliana gave birth to a daughter, Princess Beatrix Wilhelmina Armgard. Her second child, Princess Irene Emmà Elizabeth, was born Aug. 5, 1939. Her third daughter Princess Margriet Francisca was born Jan. 19, 1943, in Canada.

Princess Juliana fled from the Netherlands after the German invasion of May 10, 1940, and in June she set up residence in Rockliffe, a suburb of Ottawa, Canada. Prince Bernhard served as commander of the Netherlands interior forces under Gen. Eisenhower, when the Allies opened their advance on the continent in 1944. In Sept. 1944, Juliana rejoined her mother, Queen Wilhelmina, in England, and in July 1945, she returned to her homeland.

Jute

India, producer of most of the world supply of jute, was troubled by over-production in 1937, but the trouble disappeared quickly when World War II began in 1939. The British government ordered 200,000,000 jute bags for use as sand bags alone. World production in 1937 was estimated at 3,516,600,000 lb., of which India produced 3,462,400,000 lb. Indian production was increased to 5,268,800,000 lb. in 1940, then declined to 2,191,500,000 lb. in 1944. Although none of it was grown in the United States, jute became a crop of great importance to U.S. farmers, providing the most indispensable bagging material and burlap, and also being made into other useful cloths. Only in the latter years of the decade had cotton and paper bags been substituted for burlap in considerable quantities.

Imports of jute and jute goods into the U.S. averaged 794,000,000 lb. in the prewar period 1934–38. Exports, mostly in the form of bags, amounted to 17,000,000 lb., leaving 777,000,000 lb. for domestic consumption. In 1939, at the beginning of the war, the 858,000,000 yd. of burlap were used as follows: bags, 674,000,000 yd.; upholstery, 49,000,000 yd.; automobiles, 35,000,000 yd.; textiles, 25,000,000 yd.; carpets, 20,000,000 yd. and the rest for a wide variety of uses. By far the largest use was for bags for farm products and fertilizers, and as coverings for baled cotton. The limited shipping reduced imports from India from 262,900,000 lb. of jute and jute butts in 1937 to 78,631,000 lb. in 1939, and an average of about 150,000,000 for 1940–45. In addition about 12,000,000 gunny bags were imported annually.

Various war measures were adopted to supply the shortage of bags and cordage. Cotton and paper bags were substituted for seeds and fertilizers, and other fibres were

tried, such as abaca, sisal, henequen, etc., from South America. The distribution of the jute manufacturing industry before World War II was shown by the number of looms in different countries. India led with 66,700, Germany 9,600, Great Britain and Ireland 8,500, France 7,000, Brazil 5,000, Italy 5,000, Belgium 3,000 and the United States 2,750. All other countries made up the remainder of the total of 117,200 looms. Efforts to develop a plastic cloth substitute for burlap were not commercially successful during the war because of the lower cost of natural jute. (J. C. Ms.)

Kaiser, Henry J.

Kaiser (1882-), U.S. industrialist, was born May 9, 1882, in Canajoharie, N.Y. After 16 years with road construction projects in Canada, California and Cuba, 1914-30, he entered the dam construction field and in 1933 became head of the Six Companies, Inc.-the organization that built Boulder and Parker dams. In 1942, he obtained control of four large shipyards on the west coast. He revolutionized shipbuilding by prefabricating ship sections. Kaiser became interested in aircraft building in 1943. In March of that year he was made chairman and, in October, president of Brewster Aeronautical Corp. which was building Corsair fighters for the navy. In Jan. 1945 he was invited by Pres. Roosevelt to head the United Nations war relief clothing drive. He also headed the 1946 drive. On July 25, 1945, Kaiser and Joseph W. Frazer formed the Kaiser-Frazer Corp. and announced plans for two postwar automobiles. The corporation acquired the Willow Run bomber plant in Michigan and the Douglas Aircraft plant in Long Beach, Calif.

Kalinin, Mikhail Ivanovich

Kalinin (1875-1946), Russian statesman, was born of peasant stock Nov. 20, 1875, in Verkhnaya Troitsa, Tver (Kalinin) province. An active revolutionary from his early youth, he was frequently arrested and exiled for his agitation against Tsarist rule. In 1911, he went to St. Petersburg to join the staff of the clandestine Bolshevik publication, Pravda, and there worked closely with Lenin and Stalin. After the outbreak of the Russian Revolution in 1917, Kalinin was elected to the central committee of the Communist party and in March 1919, on Lenin's recommendation, he was elected chairman, or president of the all-Russian Central Executive committee-then the supreme governing body of the soviet union. In 1922, he became chairman of the central executive committee of the U.S.S.R. Following the adoption of the constitution in 1936, he was elected president of the praesidium of the

supreme soviet. He was also a member of the Communist party's *Politburo*. Although officially Kalinin held the post of chief of state for 27 years, actually he wielded little power. His role was that of a mild "elder statesman," known for his intense loyalty to Stalin. Kalinin retired in April 1946 as president of the praesidium because of ill health and died the following June 3.

Kallió, Kyösti

Kallió (1873–1940), Finnish statesman, began his political career in 1904, when he was elected to the Diet. He was Finnish minister of agriculture from 1919 to 1922 and four times prime minister, in 1922–24, 1925–26, 1929–30 and 1936–37. In Feb. 1937 he was elected president of Finland, remaining in office until after the "winter war" with the soviet union had ended with Finland's defeat in March 1940. Kallió resigned on Nov. 28, 1940, and died the following Dec. 19 at Helsinki.

Kaltenbrunner, Ernst

Kaltenbrunner (1901–1946), Austrian politician, studied at the University of Prague, where he won a degree as doctor of philosophy in 1926. He later practised law, became an assistant judge at Salzburg, joined the Austrian nazi party in 1932 and was leader of the SS (Elite Guards) in Austria in 1935. After the Anschluss he became the official head of the Austrian storm troopers. He was also appointed secretary of state for security in Austria, holding this post until 1941.

Kaltenbrunner was appointed chief of the security police on Jan. 30, 1943. Following the assassination of Reinhard Heydrich by Czechoslovak patriots in June 1943 he was made head of the reich security head office. He was taken prisoner in Austria by U.S. troops on May 15, 1945, and was indicted on charges of having committed war crimes by the International Military tribunal at Nuernberg, Aug. 29, 1945. He was convicted of committing war crimes and crimes against humanity, was sentenced to death and was hanged Oct. 16, 1946, at Nuernberg prison.

Kansas

A central state of the United States, Kansas was admitted to the union Jan. 29, 1861; popularly known as the "Sunflower state." Total area, 82,276 sq.mi., of which 82,113 sq.mi. are land; population (1940) 1,801,028 (a decrease of 79,971 or 4.3% from 1930). Of the state's population in 1940, 753,941 were urban, or 41.9%; 96.3% were white, 3.7% Negro and other races, 2.9% foreign born. The Kansas census of March 1, 1945, reported the population as 1,793,066, a loss of 10,842 from 1944. Capital, Topeka (67,833). The two largest cities in 1940 were Kansas City (121,458) and Wichita (114,966).

In the biennial election of 1936, Walter A. Huxman, a Democrat, had been elected governor, but Republican majorities were returned to both houses of the legislature. Other state officials in 1937 were W. M. Lindsay, lieutenant governor; Frank J. Ryan, secretary of state; George Robb, auditor; J. J. Rhodes, treasurer; Clarence V. Beck, attorney general; W. T. Markham, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance. Principal legislation for the 1937 session included provisions for soil conservation; an act regulating the relations between the state banking system and the Fed-

eral Deposit Insurance corporation; a Social Welfare act providing for co-operation with the Federal Security act, and applying to old-age assistance, to dependent children and to the blind; an act providing state aid to the weaker elementary schools; acts relating to alcoholic liquor, one legalizing for the first time since 1880 the sale of liquor containing not more than 3.2% of alcohol, and other acts providing for taxation and regulation of the liquor business. A sales tax of 2% on the sale of tangible personal property was authorized.

A special session of the legislature met in 1938 to amend the laws of the previous year respecting the financing of the social welfare program to allocate sales tax receipts and to provide for reduction in local property taxes. An emergency social welfare fund was set up to aid counties having extraordinarily heavy social welfare costs, and several special measures were passed to facilitate local school financing and to provide more effective highway and motor traffic control. In the 1938 election, Payne H. Ratner, a Republican, was elected governor, together with a Republican legislature. Other state officers elected were Carl E. Friend, lieutenant governor; Frank J. Ryan, secretary of state; George Robb, auditor; Walter E. Wilson, treasurer; Jay S. Parker, attorney general; George L. Mc-Clenny, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance. U.S. Senator George McGill, a Democrat, was defeated for re-election by Ex-Governor Clyde Reed, the result being attributed to a farm revolt against the Roosevelt agricultural program. In 1939, the regular session of the legislature enacted laws for the amendment and development of statutes relating to drainage districts, the conservation of oil and gas, grain warehouses, standards for dairy products, workmen's compensation and social welfare. More important was the adoption of a new corporation code and a probate code. The legislative council was also instructed to study administrative and tax-collecting agencies and to examine the tax code for the purpose of revising and codifying the tax laws that had accumulated since 1861. The Republican campaign pledge of exemption of food from the sales tax proved impracticable; another, the abandonment of sales tax tokens, was carried out.

In the 1940 election, all executive officers, Republicans, including Gov. Ratner, were re-elected. The governorship was decided by outstate absentee ballots: Gov. Ratner received a majority of only 430 votes. The defeated candidate, William H. Burke, unsuccessfully challenged the constitutionality of the outstate voting law. In the presidential election of 1940, Wendell L. Willkie received 489,160 votes, Franklin D. Roosevelt 364,725.

The 1941 legislature enacted the largest body of laws of any session since 1905: 401 bills and joint resolutions. Among the more important laws enacted were the teachers retirement plan, the merit system, re-enactment of the interstate oil compact, ratification of the Republican river tri-state compact, authorization of a state committee on interstate co-operation, permission to counties to receive lump-sum payment from the United States in lieu of taxes on government projects, safeguarding of absentee voting, flood control, drainage and irrigation laws, outlawing of communistic and similar parties, prohibiting labour unions from discriminating against Negroes, creation of a state home guard, authorization of a state council of defense and redistricting of the state into six instead of seven congressional districts. The defense effort in 1941 expanded greatly the aircraft industry in Wichita, and defense plants were under construction in Kansas City, Parsons and Pittsburg.

State officers elected in 1942 were: Andrew F. Schoeppel, governor; J. C. Denious, lieutenant governor; Frank J. Ryan, secretary of state (ninth term and sixth consecutive term); George Robb, auditor; Walter E. Wilson, treasurer; A. B. Mitchell, attorney general; George L. Mc-Clenny, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance (eighth term). Arthur Capper was elected U.S. senator for the fifth term. The legislative council approved 31 measures for submission to the 1943 legislature and completed the school and tax codes and prepared bills for them. The tri-state compact was vetoed by President Roosevelt, and a new com-

Natural gas

Cement . .

5,483 5,612 4,763 2,759 1,889

pact was negotiated. Wartime industrial development in agricultural Kansas was probably the most remarkable aspect of the year 1942, the state ranking third after California and New York in aircraft production. Several air training centres were assigned to the state.

The 1943 legislature passed little important legislation but enacted a number of laws growing out of war requirements. A new version of the Republican river compact with Nebraska and Colorado was signed Dec. 31, 1942, and ratified by the legislature. The long-standing problem of taxing transient cattle from the southwest, fattening in the Bluestem pastures, was given a new adjustment by offering reciprocity treatment and tax levies proportional to the time spent in the state.

In the elections of 1944 there was a Republican landslide. In the presidential election the Republican vote was 442,096; the Democratic 287,458; Socialist 1,613; Prohibition 2,609. For state offices, the Republican ticket was elected by large majorities: A. F. Schoeppel, governor; J. C. Denious, lieutenant governor; F. J. Ryan, secretary of state; George Robb, auditor; W. E. Wilson, treasurer; A. B. Mitchell, attorney general; L. W. Brooks, superintendent of public instruction. The legislative council reported 25 bills to the legislature which convened in Jan. 1945, the most important of which dealt with school legislation, a reorganization of the state department of education, an elementary school bill proposing a comprehensive reorganization of the district system and a new plan of elementary school support, including a two mill county-wide tax levy, the county and state aid funds to be used to equalize tax burdens; and a high school finance bill, also looking to equalization.

The election of Nov. 1946 resulted in a Republican landslide in Kansas. Frank Carlson was elected governor; F. L. Hagaman, lieutenant governor; F. L. Ryan, secretary of state; George Robb, auditor; R. T. Fadely, treasurer; E. F. Arn, attorney general; L. W. Brooks, superintendent of public instruction. Only Ryan, Robb and Brooks had formerly held the same office. Only 18 Democrats were elected to the lower house of 125 members, and there was one Democrat in the senate, elected in 1944, which held over. Principal interest in the campaign centred in the contest for the governorship, in which Harry H. Woodring, former governor, and former secretary of war in the F. D. Roosevelt administration, was the Democratic opponent of Carlson. The official figures gave Carlson 309,036 votes, and Woodring 254,283. Main issues of the campaign were the Republican record on liquor, social security and school reorganization. (J. C. Mn.; X.)

Keitel, Wilhelm

Keitel (1882–1946), German army officer, was born Sept. 22, 1882, at Gandersheim, Germany, near Brunswick. Entering the army in 1901, he was an artillery captain and later general staff officer during World War I, and continued in the Reich war ministry after the armistice. Known as a "political" general, Keitel ranked high in Hitler's estima-

tion and in Feb. 1938, succeeded Werner von Blomberg as chief of staff. He thus directed all major operations (under Hitler's guidance) from the Polish victory in 1939 to the final German defeat in 1945. Keitel, who headed the German delegation which signed the unconditional surrender terms in Berlin, May 8, 1945, was later arrested and held for trial as a war criminal.

At the Nuernberg trial, the prosecution produced documentary evidence showing that Keitel had approved nazi plans for seizure of Czechoslovakia, Poland, Norway, the Netherlands, Belgium and France. Although he protested against the invasion of the U.S.S.R. on strategical grounds, he finally endorsed the attack. It was also proved that Keitel had ordered the army to carry out Goering's economic directives for "exploitation" of soviet territory, food and raw materials. Found guilty of crimes against the peace, war crimes, crimes against humanity and of conspiracy to commit these crimes, he was hanged on Oct. 16, 1946.

Kennedy, Joseph Patrick

), U.S. financier and ambassador Kennedy (1888to Great Britain from 1938 to 1940, was born Sept. 6, 1888, at Boston. He was graduated from Boston Latin school in 1908 and from Harvard in 1912. In 1914 he was president and board chairman of a Boston bank, and in 1919 manager of an investment banking branch. In 1929 he was president and board chairman of Film Booking Offices of America, of Keith, Albee, Orpheum Theatres Corp., and of Pathé Exchange, Inc. In 1934 he was elected chairman of the new Securities and Exchange commission. He resigned in 1935 but returned to Washington in 1937 at the request of Pres. Roosevelt to organize the U.S. Maritime commission. On Jan. 7, 1938, Roosevelt appointed him ambassador to Great Britain. After his resignation Dec. 1, 1940, he urged aid to England and a large armament program for the United States. In 1945-46 Kennedy made investments in New York and Chicago real estate, including purchase of Chicago's Merchandise Mart.

Kenney, George Churchill

Kenney (1889-), U.S. army officer, was born Aug. 6, 1889, in Yarmouth, Nova Scotia, of U.S. parentage. He attended the Massachusetts Institute of Technology from 1907 to 1911 and later worked as a civil engineer. In June 1917 he enlisted as a flying cadet in the aviation section of the U.S. signal corps reserve. He saw active duty in France, was awarded the D.S.C. for extraordinary heroism, and held the rank of captain at the end of the war. In Jan. 1941 Kenney was promoted to the rank of brigadier general, and in Feb. 1942, major general. Transferred to the Southwest Pacific in Sept. 1942, he was placed in command of Allied air forces under Gen. Douglas Mac-Arthur and was named lieutenant general. Kenney was credited by the war department with the origin of the accurate skip bombing technique and with the invention of the fragmentation bomb dropped by parachute. In June 1944 he was named head of the newly-created far eastern air force. This command combined the 5th air force, which operated in Australia and New Guinea, with the 13th air force, which fought in the Solomon Islands, New Britain and New Ireland. Kenney participated in the Philippines campaign of 1944-45 and directed tactical air attacks on Japanese targets in the broad Pacific war theatre. He was named to the temporary rank of full general in March 1945. After the defeat of Japan, Allied headquarters in Manila revealed that Kenney's air forces

had destroyed 11,900 planes and had sunk more than 1,700,000 tons of Japanese shipping in the long Pacific campaign. In March 1946 Gen. Kenney was named head of the Allied air force strategic command.

Kent, Duke of

The Duke of Kent (Prince George Edward Alexander Edmund) (1902-1942), youngest brother of King George VI of England, was born Dec. 20, 1902. He was trained at the Royal Naval college at Osborne and served eight years at sea, first as a midshipman then as a lieutenant, but left the service in 1929 because of his health. With his brother, Edward, then prince of Wales, he made a 15,000-mi. goodwill tour of Canada in 1927 and an 18,000-mi. journey through South America in 1931. Alone, he toured South Africa. While travelling in Europe in 1934, he met Princess Marina of Greece, and their engagement was announced in August of that year. Their marriage took place on Nov. 29, 1934, and for this occasion the title of duke of Kent was revived and bestowed upon him. The couple had three children: Prince Edward George Nicholas Patrick (who succeeded to his title), born Oct. 9, 1935; Princess Alexandra Helen Elizabeth Olga Christabel, born Dec. 25, 1936; and Prince Michael George Charles Franklin, born July 4, 1942, who was given the name Franklin in honour of President Franklin Delano Roosevelt. In Oct. 1938, the duke was named to succeed Lord Gowrie, governor general of Australia, but the outbreak of World War II prevented his assuming the post (which later passed to his brother, the duke of Gloucester). In July 1941, he inspected Canadian training schools and visited President Roosevelt at Hyde Park. The duke, who was an air commodore on the staff of the inspector general of the R.A.F., was killed in active service when his flying boat, bound for Iceland, crashed in North Scotland on Aug. 25, 1942.

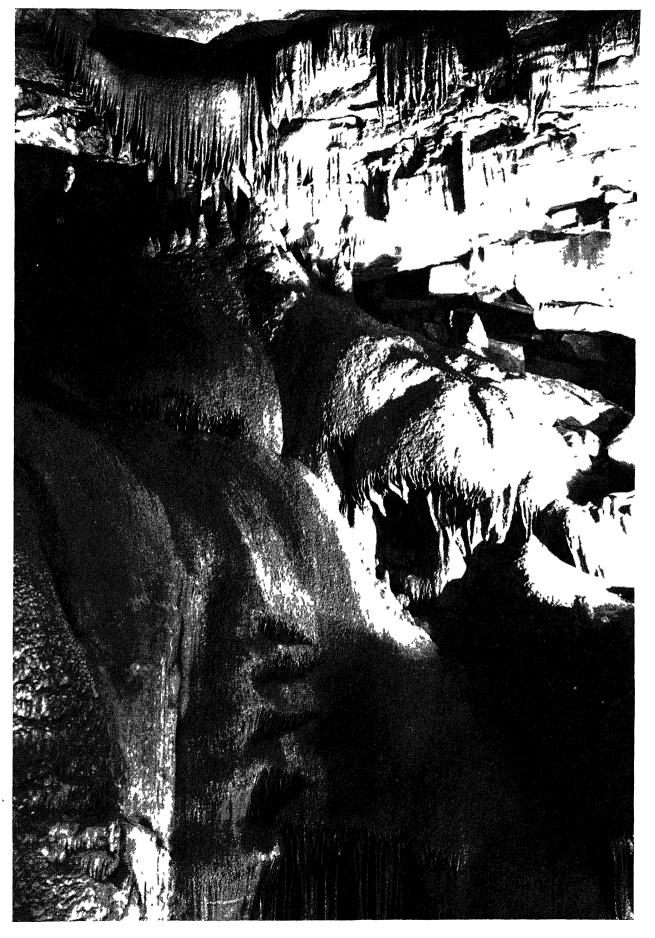

Kentucky

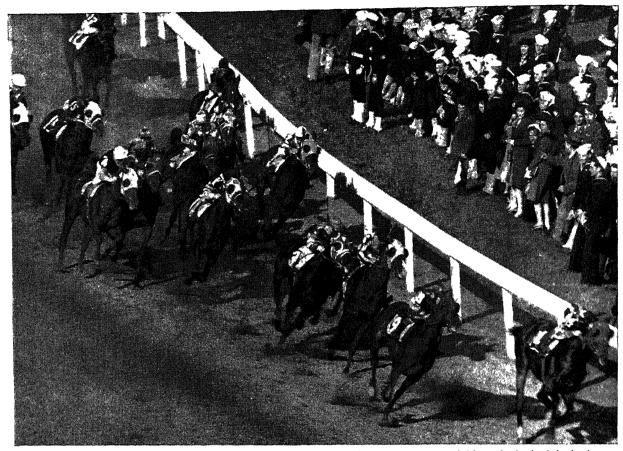

An east south central state of the United States, Kentucky was admitted to the union June 1, 1792, popularly known as the "Blue Grass state." Area, 40,395 sq.mi. (286 sq.mi. water), population (1940) 2,845,627, of which 1,996,300 or 70.2% was rural and 849,327 or 29.8% urban. Negroes constituted 214,031 or 7.5%; and 15,631 were of foreign birth. Population as of July 1, 1944, was estimated at 2,630,194. Capital, Frankfort (11,492); largest city, Louisville (319,077). Other cities: Covington (62,018); Lexington (49,304); Owensboro (30,245); Paducah (33,765); Ashland (29,537).

Principal state officers at the beginning of 1937 were Albert B. Chandler, governor; Keen Johnson, lieutenant governor; H. M. Meredith, attorney general; H. W. Peters, education; G. K. Ferguson, agriculture. The Reorganization act of 1936 had consolidated scores of administrative boards under three groups: constitutional (seven), statutory (ten) and independent agencies (five). Under the last was a legislative council to prepare legislation for the biennial meetings of the general assembly. An Ohio river flood in Jan. 1937 cost the lives of 50 persons and caused property damage of \$139,800,000 in 54 counties. Severe losses occurred in Covington, California, Louisville and Paducah.

The general assembly met in Jan. 1938 in regular ses-

Mammoth cave in central Kentucky was formally dedicated as a national park on Sept. 18, 1946. This is a detail of the interior showing picturesque stalactites

sion, and in two special sessions immediately thereafter. Legislation enacted totalled 1,100 pages, much of which extended and amplified the Acts of 1936 along the lines of the national program of social and economic welfare. The assembly also passed an Alcoholic Beverage Control act, made new rules for several professions, set up a teacher's retirement plan and fixed a minimum wage rate of 25 cents per hour. In Nov. 1938 the electors returned eight Democrats and one Republican to the lower house of congress, and gave Sen. Alben W. Barkley, administration leader, a majority of 134,469 votes over his opponent, John P. Haswell.

On Oct. 9, 1939, Gov. Chandler resigned his office to fill the unexpired term of Sen. W. M. Logan, deceased. Lt. Gov. Johnson, who succeeded him, was nominated in the August primary, and elected in November by 460,834 to 354,704 votes over his opponent, King Swope (Rep.). Other state officers, also Democratic, were R. K. Myers, lieutenant governor; H. Meredith, attorney general; J. W. Brooker, education; W. H. May, agriculture. The general assembly was also strongly Democratic: 28 of 38 votes in the senate and 72 of 100 votes in the house. The legislative council prepared a number of measures pertaining to increased payments for the aged poor, unemployed, the teacher's retirement fund and budgetary problems.

Efforts of the United Mine workers to secure a new contract in the Appalachian field in April 1939 assumed national importance. The Operators' association of Harlan county resisted demands by John L. Lewis, who denounced Gov. Chandler as an enemy of labour. In reply the governor sent troops on May 10 to maintain order, increasing the force as union agitators became active. The U.S. courts indicted 52 coal companies for conspiracy. In Aug. 1939 peace was imperilled by a clash in Bell county,

Pensive (number 5, at extreme left) ran far back of the leaders on the first turn of the Kentucky Derby, May 6, 1944, but came from behind to win the \$64,675 purse

but only one death could be directly attributed to some five months of military occupation. The operators finally signed varying contracts, and on Oct. 3 the courts dismissed the cases against the companies.

In the presidential election Nov. 5, 1940, Roosevelt electors carried the state with 557,222 votes to 410,384 for the Republicans. The Prohibition vote was 1,440; the Socialist, 1,014. Sen. Chandler defeated W. B. Smith (Rep.) by 561,151 votes to 401,812, for the U.S. senate. A Republican, John M. Robsion, was elected in the 9th districteight other districts electing Democrats to congress. The general assembly of 1940 approved a legislative program which supplemented and co-ordinated many national objectives, such as housing projects, rural credits and conservation plans, adjusting them to local conditions. The first soil conservation district to stop erosion and retire marginal tracts from cultivation was created in Logan county. Other boards were appointed to investigate farm tenancy, supervise distribution of surplus U.S. food commodities and certify WPA workers and CCC boys to their respective officers. Considerations of public health and safety doubtless required the passage of a law prohibiting ophiolatrous practices in any religious service or gathering.

In the November election of 1941 the voters returned a general assembly overwhelmingly Democratic: 75 Democrats in the lower house of 100 members, 29 in the senate of 38 members. Two constitutional amendments were adopted, the first providing that the general assembly "may by general law distribute not to exceed 10% of the school fund on other than a census-pupil basis." The second authorized any county to use voting machines at its own expense.

In 1942 the regular session of the general assembly increased the penalties for prostitution; granted more leniency in paroling convicts during the war period; voted a war emergency fund of \$500,000 for the governor's use; and reduced state holidays to three: July 4, Labor day, Christmas. At the special session (March 10 to April 8) the various legislative districts were rearranged, both state and federal. In the election of Nov. 3, 1942, all the congressmen were re-elected. Sen. Chandler won by 216,958 votes to 175,081 for his opponent, R. J. Colbert.

Simeon S. Willis (Rep.) was elected governor in the 1943 state election. The Republicans also elected Kenneth H. Tuggle, lieutenant governor; Eldon S. Dummit, attorney general; Irvin Ross, auditor; Thomas W. Vinson, treasurer; John Fred Williams, state superintendent of public instruction: Elliott Robertson, commissioner of agriculture. The Democrats elected the secretary of state, Charles K.

O'Connell, and the general assembly remained Democratic in both branches. In a special congressional election Chester O. Carrier (Rep.) defeated J. Dan Talbot (Dem.) in the fourth district. Amendments to the state constitution which would extend workmen's compensation and raise limitations on salaries were rejected.

In the presidential election of Nov. 1944, Pres. Roosevelt's plurality was 80,141. The Democrats also returned Sen. A. W. Barkley and eight congressmen. In the 9th district, however, the Republicans returned John M. Robsion. Under the statute of 1942 absentee ballots were used for the first time, resulting in a service vote of 31,672, and civilian votes numbering 7,046. The legislature's regular session and a special session, May 19 to June 12, failed to come to terms on the governor's budget bill, but a second extra session, from June 12 to 16, completed the budget, including \$5,300,000 for tuberculosis sanatoriums.

In the election of Nov. 6, 1945, the Democrats carried the general assembly, winning by 71 to 29 over the Republicans in the house and 21 to 17 in the senate. Two constitutional amendments were adopted, the first continuing the absentee ballot system first adopted by the general assembly in 1942. The second amendment provided that all funds obtained for the benefit of public roads be devoted exclusively to that purpose. On Nov. 19 Gov. Willis appointed William A. Stanfill U.S. senator to fill the vacancy caused by Sen. A. B. Chandler's resignation.

In the election of Nov. 5, 1946, John Sherman Cooper (Rep.) was elected U.S. senator for two years over John Y. Brown (Dem.) by 41,823 votes. The Republicans also elected congressmen in the third, seventh and ninth districts. The general assembly of 1946 passed 248 acts. It adopted a motor responsibility act for all accidents involving damage of more than \$50. (E. T.; X.)

Kesselring, Albert

Kesselring (1887-), German army officer, began his career as an aviator in World War I. His friendship with Reichsmarshal Hermann Goering aided his rise, and in 1936 he was appointed first chief of the luftwaffe's general staff. He later resigned when his technique of air operations met with disapproval. The shake-up in the German high command in Feb. 1939 brought Kesselring back to favour, however, and he directed air operations in the Polish campaign of 1939 and the attacks upon the Netherlands, Belgium and France in 1940. Kesselring was then promoted by Hitler to the rank of general field marshal. He commanded a German aviation unit on the U.S.S.R. front in 1941-42, and was appointed chief of the luftwaffe in Italy in Feb. 1942. In Sept. 1943 Kesselring was placed in command of the central Italian front, and he assumed over-all command of the wehrmacht in Italy after Rommel's departure for the western front. In May 1945, Kesselring was captured by troops of the U.S. 7th army. He was then indicted by the Allies as a major war criminal.

800 Kidnapping

Unusual kidnap cases of the years 1937-46 included a number with international features. Palestine, Mexico and China provided the sites for practically all of these.

In 1939 the Rev. J. H. Goldner and his son Rev. G. R. Goldner, U.S. missionaries, were kidnapped by Arab bandits. Upon payment of the demanded ransom, they were released. In 1940 R. Bullen was abducted by robbers in Jerusalem. In 1941 there were wholesale seizures of Jewish leaders by Arab nationalists acting, it was said, in response to mass arrival of Jewish immigrants from the Balkans.

Many of the major kidnappings in China during the decade also had a distinctly international character. One that attracted especial attention involved Frank Poletti, Italian postal commissioner, who was kidnapped in Peiping early in 1939. The Italian embassy provided ransom, whereupon Commissioner Poletti was released. Not long thereafter, H. F. Dyott, chairman of the British Chamber of Commerce in Tientsin was seized by bandas and held for ransom, while in 1941 Mrs. Denzil Clark, Japanese-born wife of a British embassy press attaché, was seized by Japanese extremists but was later released through official intervention.

Mexican cases with international features included the seizure of J. W. Reid by bandits in Mexico City in 1940, and the announcement of the U.S. Federal Bureau of Investigation (qv.) in 1939 that with the arrest of five Japanese and one Mexican in Los Angeles, who were charged with the kidnapping of O. Lampe at Guanajuato, Mexico, an international kidnap ring had been broken.

Other cases of international interest were the direct outgrowth of World War II. Especially notable was that involving the Austrian nazi, Arthur Seyss-Inquart, who later died on the international tribunal's gallows at Nuernberg. Gauleiter Seyss-Inquart's daughter was seized and held as a hostage by Netherlands patriots in 1943. In the same year there was a Japanese attempt to kidnap the British consul at Macao. The following year was also featured by what was probably a political kidnapping in occupied Denmark when K. Munk was abducted and slain in the Silkeborg area.

Largest scale kidnappings were those attributed to nazi policy of mass seizures of children of various nationalities. In 1946 the United Nations Relief and Rehabilitation administration announced that existence of a systematic German policy of kidnapping, involving children in occupied countries had been established as a result of its European investigations during the postwar period.

War also had its influence upon kidnappings in other lands. In common with other crimes, ransom kidnappings everywhere tended to decline during the war years; but with the return of peace and the demobilization of armies throughout the world there were many signs of a return to the former levels. Also returning to the criminal dockets were the activities of the Mafia, which had been vigorously suppressed in Sicily by Mussolini's police state.

During the ten-year period there were almost 200 kidnappings in the United States, although ransom was demanded in less than a score. In the others the abductions preceded auto thefts, burglaries, robberies and murders, but with these primary objectives attained the victims of kidnapping were usually released without great harm.

In four U.S. kidnappings, however, children of tender years were killed by their abductors, and the resulting search aroused a public interest so extraordinary as to be reminiscent of the Lindbergh case of the early 1930s. In

two of these cases of outstanding popular interest, no ar rests had been made or convictions secured by the end of 1945; but they constituted the only unsolved kidnap cases, out of some 300, handled by the FBI after that agency acquired jurisdiction in June 1932.

Dawn of the ten-year period found police searching for ten-year-old Fletcher Mattson, son of a Tacoma, Wash., physician, who had been kidnapped in Dec., 1936. A few weeks later the boy's battered and lifeless body was found, but although the search for his abductor was unremittingly pressed, the ten years yielded no conclusive evidence of guilt. A somewhat similar case arose in the very next year in New Rochelle, N.Y., where 12 year old Peter D. Levine, was kidnapped. His body was later recovered, but the persons responsible were still being sought at the end of 1946.

These two fatal cases in themselves aroused more than the usual amount of popular concern, but the fact that no final disposition had been made of them after so long a period lent them a special importance in the annals of kidnapping investigations.

Equally revolting in their criminal features were two other kidnappings which had fatal consequences for the victims but were accompanied by more successful investigative results:

In 1938, five-year-old James Bailey Cash was taken from his bed in his parents' home in Princeton, Fla., and held for \$10,000 ransom. After an intensive investigation by the FBI, F. P. McColl, aged 21, a resident of the same town was apprehended and charged. He promptly confessed the crime. The ransom which had been paid over to McColl was recovered, as was the kidnap victim's lifeless body. McColl received the death penalty.

Just as the beginning of the ten-year period had been featured by a kidnapping of unusual ferocity, its final year produced a somewhat similar crime. When Suzanne Degnan, aged six, was kidnapped from her parents' home on the north side of Chicago in Jan. 1946, there was some idle speculation that the crime might have been an act of retaliation against her father, who was employed in the federal Office of Price Administration. All hope that the case might be quickly and easily solved vanished, however, when parts of the child's dismembered body were recovered in the immediate neighbourhood of the kidnapping This brought suspicion to bear upon various persons who, police said, could not give a ready explanation of their actions on the date in question, and led to premature declarations by Chicago police that a solution was only a matter of hours. But the promised definite action was not forthcoming, and it was not until June 1946 that William Heirens, a student at the University of Chicago, who had been arrested for burglary, was tentatively connected with the crime. First there was a suggested similarity between Heirens' fingerprints and those found on the ransom note, later there were indications of a similarity between Heirens' handwriting and a message written on a wall at the scene of an earlier murder. Slowly the evidential fragments were pieced together. After considerable manoeuvrings Heirens confessed, but sought to avoid criminal responsibility. He was sentenced to life imprisonment.

Probably the best example of a kidnap solution through public participation was that of three-year-old Marc de Tristan, who was taken from the custody of his nurse in Hillsboro, Calif., in 1940. Ransom of \$100,000 was demanded. The kidnapper was later seized by two lumbermen who acted solely on the basis of published descriptions. The victim was found unharmed.

Other kidnappings in various parts of the world in

cluded numerous cases in Shanghai in 1940 and 1941, culminating in the abduction of nine employees of the Central Bank of China. In 1937 Eugenio Pereyra Iraola, two-year-old son of an Argentine cattle rancher, was seized by a kidnapper who later confessed the crime and committed suicide. At least a trace of European politics seemed to be involved in the abduction of I. Haugen, a Norwegian resident of Brooklyn, in New York city; he declared in 1940 that he had been kidnapped by "nazi sympathizers." In 1942 Latin America again was featured when Cesar Rodriguez was wounded and his nephew Evenicio Hurriz was killed, while fighting off three kidnappers. Maximo Del Llana was arrested and held for the crime.

Even Canada found a place in kidnap history during these extraordinary years. In 1937 seven Canadians were released after pleading guilty to seizing their employer and transporting him to the United States border, while in 1943 W. P. Forshee, branch manager of the Royal Bank of Canada at Wheatley, Ont., was forced to leave his home and to open the bank vaults. The six bandits involved in this burglary-kidnapping made good their escape after looting the bank.

Reminiscent of the Lindbergh case in the manner in which ransom money was employed to trace a kidnapper, was the solution of the Ross case. Charles S. Ross (whose name served to recall that of another kidnap victim of several generations earlier) was a Chicago merchant. Four months after Ross was kidnapped in Sept. 1937, John Seadlund was seized at far-off Santa Anita race track in the act of betting money identified as having been paid by the family of Ross in a vain effort to effect his release. Seadlund confessed that he had killed both Ross and his own confederate in the kidnapping, but this unfortunate end to an otherwise successful investigation did not obscure the

Chicago police studying "hidden writing" on a ransom note written by William Heirens, later convicted for the kidnapping and slaying of a 6-year old child in Jan. 1946 skill and persistence of the FBI in handling this and other cases.

Kimmel, Husband Edward

), U.S. naval officer, was born at Kimmel (1882-Henderson, Ky., on Feb. 26, 1882. He was graduated from the U.S. naval academy in 1904. By 1937 he had risen to the rank of rear admiral; on Feb. 1, 1941, he was made commander in chief of the Pacific fleet and promoted to admiral. On Dec. 17, 1941, ten days after the Japanese attack on Pearl Harbor, Kimmel was relieved of his command. In Jan. 1942, the report of a special investigating commission headed by supreme court Associate Justice Owen J. Roberts placed blame for the Pearl Harbor disaster on Kimmel and Lt. Gen. Walter C. Short (q.v.). Kimmel's application for retirement was granted in Feb. 1942. On July 20, 1946, a joint congressional investigating committee in its majority report said Kimmel's errors were those of judgment and not dereliction of duty.

King, Ernest Joseph

King (1878—), U.S. naval officer, was born Nov. 23, 1878, in Lorain, O. He left Annapolis to serve in the Spanish-American War, returning to the naval academy to graduate in 1901. During World War I he was assistant to the chief of staff of the commander in chief of the U.S fleet. Promoted to the rank of rear admiral in 1933, he served as chief of the bureau of aeronautics until 1935. In 1938 he was named vice admiral and was placed in command of the fleet's aircraft battle force. He was appointed commander of the Atlantic fleet on Feb 1, 1941.

During the shake-up of commands following the attack at Pearl Harbor, King replaced Husband E. Kimmel as chief of the U.S. fleet, including all U.S. naval operating forces in Atlantic, Pacific and Asiatic waters. He was later also appointed chief of naval operations. In 1943 and 1944 King participated in several military and naval conferences dealing with British-U.S. war strategy. His planning was credited with the destruction of Japan's naval power in 1944 and 1945. On Dec. 14, 1944, he was promoted to the newly created rank of fleet admiral, along with Chester W. Nimitz and William D. Leahy. King was succeeded by Nimitz as commander of the fleet and chief of naval operations in Nov. 1945. Named to the National Defense council in March 1946, he was awarded the permanent rank of admiral.

King, William Lyon Mackenzie

King (1874-), Canadian politician, was born at Berlin (Kitchener), Ont., Dec. 17, 1874. His grandfather, William Lyon Mackenzie, had been prominent in the struggle for political freedom in 1837. King entered parliament in 1908, became leader of the Federal Liberal party in 1919, and was returned to office as prime minister for the third time on Oct. 23, 1935. Following Canada's entry into World War II, the King government came under attack of his political foes. The growing controversy over the question of conscription for overseas duty reached a crisis in 1944; King's proposal on Nov. 23 to send overseas 16,000 of the 42,000 "home service" draftees, under authority of the National Resources Mobilization act, precipitated a storm of protest, particularly in the Frenchspeaking province of Quebec. After several weeks of violent debate, however, the house on Dec. 8, 1944, voted 143 to 70 to "aid the government in maintaining a vigorous

King co-operated with the United States in measures for common defense of the two countries, and he participated in several Churchill-Roosevelt conferences. In the general elections held June 11, 1945, King's Liberal party emerged victorious although it failed by a slim margin to obtain a clear majority. King himself was defeated in his constituency in Prince Albert, Sask., but was re-elected in a parliamentary by-election in Ontario, Aug. 6. He participated with Truman and Attlee in the Washington conference on atomic energy, Nov. 15, 1945. On Feb. 15, 1946, King announced that 22 persons, including some members of the U.S.S.R. embassy staff in Ottawa were being held for questioning on espionage activities. Russia admitted its military attaché in Canada had obtained information, but denounced King's government for publicizing the investigation before consulting Moscow. On March 18 King told commons that Canada had been used by Russia as a base to obtain information on the atomic bomb, but he rejected talk of a diplomatic rupture between Canada and the soviet union.

Kinkaid, Thomas Cassin

Kinkaid (1888—), U.S. naval officer, was born April 3, 1888, at Hanover, N.H., and was graduated from the U.S. naval academy at Annapolis, Md., in 1908. In World War I, he served with the British admiralty, and later became gunnery officer of the U.S.S. "Arizona." He played an important part in 1942 in both the battle of the Coral sea

and the battle of the Solomon Islands. The following year he was named commander of the naval force in the North Pacific, with direction of joint military operations in that area. In this capacity Kinkaid engineered the unopposed landing of U.S. forces on Kiska Island in the Aleutians in Aug. 1943. He was promoted to the rank of vice-admiral in June 1943, and in November of the same year became commander of the 7th fleet. In April and May, 1944, he supported Allied landings at Biak Island and at Hollandia in New Guinea. In the battle for Leyte gulf, in October, his fleet knocked out two Japanese navy forces. The 7th fleet covered U.S. ground forces invading Luzon (Jan. 9, 1945). In March 1945 Kinkaid was promoted to the rank of a full admiral. In November he was succeeded as commander of the 7th fleet by Vice-Adm. Daniel E. Barbey, and on Jan. 19, 1946, Kinkaid formally took over command of the 16th fleet and the eastern and Gulf sea frontiers.

Kirghiz S.S.R.

See Union of Soviet Socialist Republics.

Kirk, Alan Goodrich

), U.S. naval officer, was born in Phila-Kirk (1888delphia, Pa., Oct. 30, 1888. He was graduated from the U.S. naval academy at Annapolis in 1909. He was on the gunboat U.S.S. "Wilmington" at Canton, China, during the Sun Yat-sen revolution. In 1916 he was assigned to the naval proving ground at Indian Head, Md., and served there as proof and experimental officer throughout World War I. Kirk served as U.S. naval attaché and naval attaché for air in the U.S. embassy in London during 1939-41. He became director of U.S. naval intelligence in 1941. He led a task force into Sicily in Aug. 1943, landing a division of soldiers and their supplies under almost continual axis bombing and retiring without loss of a ship. In Feb. 1944, he was appointed commander of the U.S. naval task force in England and first chief of staff to Adm. Harold R. Stark. He also commanded one of the task forces in the invasion of France. In Oct. 1944 he was named commander of U.S. naval forces in France. On Jan. 21, 1946. Kirk was appointed by Pres. Truman as ambassador to Belgium and minister to Luxembourg.

Kleffens, Eelco Nicolaas van

Van Kleffens (1894—), Netherlands statesman, was born Nov. 17, 1894, in Heerenveen, the Netherlands. Graduated from Leyden university in 1918, he joined the toreign service and was a member of the League of Nations secretariat, 1919–21. In 1923 he was attached to the Netherlands foreign ministry and was chief of the diplomatic section from 1929 to 1939. After the fall of the Netherlands in May 1940, he fled to England, where he became foreign minister for the Netherlands government-in-exile.

In 1944 he voiced his concern over the Big Three's assumption that machinery for postwar security would be dominated by the four or five largest powers. He maintained this view at the sessions of the United Nations in San Francisco in 1945 and the first London sessions in early 1946 and the New York sessions. During the London sessions of the U.N. Security council, the Netherlands foreign minister clashed with Andrei Y. Vishinsky over the

latter's demand (Feb. 10, 1946) for an investigation of the Indonesian dispute. On Feb. 26, 1946, Van Kleffens was named the permanent Netherlands representative to the U.N. Security council.

Kleist, Paul Ludwig von

), German army officer, was born on Kleist (1881-Aug. 8, 1881, in Braunfels, Prussia. Descendant of an old Junker family, he served as a lieutenant of hussars and regimental commander in World War I. After the Armistice he was a cavalry instructor in Hanover, but Hitler lifted him from the obscurity of the classroom to command of an army corps. Kleist participated in successful operations in Poland in 1939 and in France in 1940, and led the mechanized column that took Belgrade in the Yugoslav campaign of 1941. Early in the Russian campaign, his tank army led the attack on Kiev and the advance through the Ukraine. Kleist's armies also captured Dniepropetrovsk in Aug. 1941, but this proved a pyrrhic victory, since the Russians had destroyed the famous dam there before retiring. In Nov. 1941 they captured Rostov, only to lose it a week later when Gen. Timoshenko launched a counteroffensive.

When the nazis renewed their offensive in the summer of 1942, Kleist's 1st German tank army drove through to the foothills of the Caucasus. The following year the Russians succeeded in driving the Germans back, and in April 1944 it was reported that Kleist had been replaced by Gen. Schoerner. Just prior to the defeat of Germany in May 1945, Kleist was captured by U.S. troops.

Kluge, Guenther von

Kluge (1882-1944), German army officer, was a scion of an old Prussian family. In World War I, he served with the German general staff and was wounded in the battle of the Marne. Continuing his career in the army after the Armistice, he was promoted to major general in 1933, and was chief of staff for Gen. Walther von Brauchitsch in East Prussia.

Three years later, Kluge, now a full general, led German forces that reoccupied the Rhineland.

During World War II, he commanded wehrmacht forces that invaded the Polish Corridor during the Polish campaign in 1939. He was later promoted to field marshal and directed one of the German armies that broke into France in 1940. Transferred to the eastern front in the summer of 1941, he led one of the German armies that surged through the U.S.S.R. only to be stopped at the gates of Moscow in Dec. 1941. The following year, he was in command of wehrmacht forces on the central sector of the soviet front.

After the German failure to prevent the Allied landings in Normandy in 1944, he replaced Runstedt as commander of German armies in the west in July. In October, it was announced that Runstedt had been restored to his old post and in December, the British radio quoted a German high command order dated Aug. 31, 1944, which said that Kluge had committed suicide. New light on the mystery surrounding his death was shed June 11, 1945, in a U.S. press dispatch from Berchtesgaden. Kluge, according to this account, had been involved in the abortive plot to slay Hitler in July 1944. On the day of the attempted assassination, Kluge had allegedly made a secret rendezvous with U.S. 3rd army officers near Avranches, Normandy.

Because the U.S. contingent was delayed in reaching its meeting place, Kluge hurried back to headquarters, where he discovered that the plot had failed. Ordered back to Berlin, Kluge took a fatal dose of poison, rather than face Hitler's vengeance.

Knowlson, James S.

Knowlson (1883-), U.S. industrialist, was born June 29, 1883, in Chicago. After graduating from Cornell university in 1905 he worked as an electrical engineer in Schenectady until 1909. He was chairman of the board and then president of Stewart-Warner corporation. In Sept. 1941 he was appointed deputy director of the Office of Production Management priorities division as a dollar-ayear man. He was named head of the War Production board division of industrial operations in Jan. 1942, and was charged with the task of speeding the conversion of U.S. factories to war production. When Chairman Donald Nelson realigned the WPB on July 10, 1942, the conversion problem was declared solved, and Knowlson was made vice-chairman on the WPB program determination staff. Two months later Ferdinand Eberstadt succeeded Knowlson in this post; it was then explained that Knowlson needed more time to devote to his increasingly heavy duties on the British-U.S. Combined Production and Resources board, of which he was a member. He was also chairman of the U.S. section of the Canadian-U.S. Joint War Production committee, an agency which had been set up to speed war production of both countries. He retired from the latter post in Dec. 1942, and resigned as WPB vice-chairman in Jan. of the following year. From May to Sept. 1945, Knowlson was in charge of the disposition of surplus U.S. military supplies in Europe. He then returned to the Stewart-Warner corporation as president.

Knox, (William) Franklin

Knox (1874-1944), U.S. publisher and secretary of the navy, was born Jan. 1, 1874, in Boston, Mass. He served with Theodore Roosevelt's Rough Riders in the Spanish-American War, and during World War I served in France as a colonel in the 365th field artillery. In 1931 he became publisher of the Chicago Daily News. Politically a nonconformist, Knox began as a Republican, but broke away from the party in the 1912 election to join the Progressive Republican, or "Bull Moose" party. In 1936 he was Republican candidate for vice-president. Franklin D. Roosevelt named him secretary of the navy June 20, 1940. Knox was branded as a renegade by many G.O.P. leaders for accepting this post, but his answer was that he was "American first and a Republican afterward." After the Pearl Harbor disaster Knox promptly overhauled the navy high command and introduced an immediate program of naval expansion, through which the U.S. fleet became by 1944 the strongest afloat. Knox died in Washington, D.C., April 28, 1944.

Knudsen, William Signius

Knudsen (1879-), U.S. industrialist, was born in Copenhagen, Denmark, on March 25, 1879. At the age of 20 he emigrated to the United States, where he worked in a shipyard and in a railroad shop in New York. After a period as superintendent of a mill in Buffalo, he became associated first with Ford Motor company and then with

Chevrolet Motor company; he was named vice-president of the latter firm in 1922 and later became president. In 1933 he was appointed executive vice-president of General Motors corporation and in 1937 he became president.

On May 28, 1940, Pres. Roosevelt appointed Knudsen commissioner of industrial production for the national defense advisory commission. When the Office of Production Management was created on Jan. 7, 1941, Knudsen was named director general. He continued to be the most important figure in the production phase of national defense until Jan. 1942, but gradually matters of general policy were delegated to other agencies such as the Office of Price Administration and the War Production board. On Jan. 16, 1942, he was appointed production director of the war department and was made a lieutenant general. During the following two years he spent much of his time in the field, visiting and counselling industries and otherwise expediting production. Knudsen then served as director of the Allied air forces material and service command from July 1944 to April 1945, when he returned to the war department. On June 1, 1945, he resigned and returned to General Motors corporation.

Koenig, Joseph-Pierre

), French army officer, was born in Koenig (1900?-Caen, the son of an Alsatian army officer. He fought with the infantry during World War I, and saw action in the Rif campaign from 1924 to 1926. In World War II he participated in the ill-fated Narvik campaign in Norway of April 1940, where he was promoted to the rank of major. During the German invasion of France in May and June 1940, Koenig fought in the Brittany peninsula and was evacuated to England just before the armistice. He and his regiment immediately joined the De Gaullist forces. Koenig achieved renown for his stubborn 15-day stand against attacks by Rommel's panzers at Bir Hacheim in North Africa in May and June 1942. In Aug. 1943 he was made assistant chief of the French army general staff. He became chief liaison officer between Gen. Dwight D. Eisenhower and the French forces of the interior in April 1944, and in June Eisenhower named him commander of all F.F.I. forces in France. Koenig's armies developed into a unified and well-disciplined force of more than 175,000 men. Their forays disrupted German communications and pinned down a large part of the wehrmacht behind Allied lines in France. On Aug. 21, 1944, when F.F.I. troops and the citizenry of Paris staged an uprising against the German occupation troops, De Gaulle named Koenig military governor of the French capital. He occupied this position until July 1945, when he became French representative on the Allied Control council for Germany.

Koiso, Kuniaki

Koiso (1880—), Japanese army officer and statesman, was educated at the Military Staff college, where he later served as instructor. He then acted as chief of the general military aviation headquarters, director of the military preparatory bureau, director of the military affairs bureau, and chief secretary to the Supreme War council. In 1932 he became vice-minister for war and a member of the staff of the Kwantung army in Manchuria. He commanded the 5th Japanese division in 1934 and the Korean army in 1936. Koiso was minister for overseas affairs in 1939 and 1940 in the Hiranuma cabinet and was appointed governor general of Korea in May 1942. In July 1944 he was named premier of Japan, succeeding Gen. Hideki

Tojo, whose resignation followed a series of military setbacks. Koiso was known as a staunch disciple of Japan's "special mission" of aggression and expansion in east Asia. By March 1945 the military position of Japan had become critical and Koiso was forced to ask for sweeping emergency powers to prepare for an eventual Allied invasion. But in April his cabinet was ousted to make way for a more "powerful" regime. Koiso surrendered to Allied occupation forces on Nov. 23, 1945.

Komorowski, Tadeusz

Known also as Gen. Bor, Komorowski (1898-Polish army officer, was born near Lwow, the son of a farmer. As a student member of the underground Polish organization, he was wounded during the uprising against the Germans in Warsaw in Nov. 1918. He joined a Polish cavalry regiment after Poland won its independence, studied military tactics in the École de Guerre in Paris, and in 1926 was promoted to the rank of lieutenant colonel. During the German invasion of Sept. 1939, Komorowski commanded a cavalry brigade. He subsequently joined the Polish underground army, and Gen. Wladyslaw Sikorski appointed him deputy to Gen. Grot, commander in chief of the Polish home army. Grot was arrested in Warsaw in June 1943 and Komorowski became his successor. It was said that he adopted the name "Bor" from the Polish word meaning forest, where his first headquarters were located. On Aug. 1, 1944, when the Red army neared Warsaw, the Polish government in London ordered Komorowski to launch an uprising in the Polish capital. He met with some initial success in the early phases of the revolt, but the promised Russian drive into the city failed to materialize and the Germans crushed the revolt after 63 days of bitter fighting. Komorowski was forced to surrender to the Germans on Oct. 5. After the liberation of Poland and the establishment of the new Polish government, Komorowski was removed as commander in chief of the Polish army. Going into exile, he became a bitter opponent of the Russian-sponsored government of Poland. In May and June 1946 he travelled to the United States, where he was feted by Polish-American societies in Chicago and New York.

Konev, Ivan Stepanovich

Konev (1897?—), Russian army officer, came of peasant stock and joined the Red army as a youth. At the age of 20 he, with his wife, organized guerrillas in the far east, fought against the Kolchak (White Russian) army and subsequently commanded an armoured train against the Japanese. In 1921 he participated in the attack that subdued the Kronstadt naval rebellion. He was an important political figure as well; from 1931 to 1934 he was a member of the All-Union Central Executive committee, and in 1939 he became an alternate member of the Central committee of the Communist party.

Konev was soviet commander in the west when Germany attacked the U.S.S.R. in 1941, and led the first real counterattack of the war. He was withdrawn to form what became the northwest front army, which went into action with the opening of the Moscow counteroffensive in Dec. 1941. In the critical summer of 1942 Konev led a six-week operation against Rzhev, tying down large German forces which might otherwise have been sent to assist the 6th German army at Stalingrad. Konev was one of the generals under whose direction the Russian armies in 1943 broke Germany's third summer offensive. In Aug. 1944 his army crossed the Vistula river, south of Warsaw, penetrating the last German stronghold before Germany proper. He was

awarded the Order of Suvorov in 1943 and in March 1944 was promoted to the rank of marshal of the soviet union. Konev's 1st army was in the forefront of the great Russian drive launched from Poland in mid-Jan. 1945; his forces, together with Marshal Zhukov's, entered and captured Berlin. After Germany's surrender Konev was made commander of Russian occupation forces in Austria.

Konoye, Fumimaro

Prince Konoye (1891-1945), Japanese statesman, was born at Kyoto in Oct. 1891, son of Prince Atsumaro Konoye and descendant of one of Japan's oldest families. He was graduated from Tokyo Imperial university's law college in 1917, and was a member of Prince Saionji's delegation to the Paris peace conference the following year. After serving in the house of peers, he was prime minister, 1937-39, and during this term of office sanctioned the war on China. He subsequently became minister of state without portfolio and president of the privy council. In July 1940, after the resignation of Adm. Mitsumasa Yonai, he again became prime minister. He then organized the Imperial Rule Assistance association and also headed the Great Japan and Asia Development league, whose major goals were conquest of Asia and maintenance of close bonds with the axis. From all appearances, Konoye's ministry was dedicated to "moderation" in foreign affairs. Konoye resigned, July 16, 1941, and formed a new cabinet two days later without his foreign minister, Yosuke Matsuoka. This new government lasted only three months, and the prince was succeeded in Oct. 1941 by Gen. Hideki Tojo, who plunged Japan into the disastrous war with the United States. After the Japanese defeat, Konoye was ordered by Gen. MacArthur to stand trial as a war criminal. On the night that he was to give himself up-Dec. 16, 1945-Konoye committed suicide by taking poison. His son later disclosed political memoranda compiled by Konoye before his death, in which the prince put the burden of the blame for Japan's decision to attack the United States on Tojo and Matsuoka.

Korea

Part of the Japanese empire from 1910 until the defeat of Japan in World War II, Korea in 1945 became a theoretically independent state under Russian and United States military occupation. It is a peninsula extending south from northeastern Asia, between the Sea of Japan on the east and the Yellow sea on the west. To the north, it adjoins Manchuria and the maritime province of Siberia. The population on Oct. 1, 1940, was 24,326,327; area (including 1,018 adjacent islands), 85,225 sq.mi. Capital: Seoul (Keijo), pop. (1940) 935,464. Other principal cities: Pyengyang (Heijo) (285,965); Fusan (249,734); Seishin (197,918).

Prospects were never blacker for Korea than in the middle 1930s, when there was no hint of the emancipation that was to come within a decade. Japan had conquered neighbouring Manchuria, was in practical control of a part of North China, and in 1937 launched its war upon all China. In the meantime, it was fortifying the mandated islands and exerting increasing authority in southeastern Asia.

The liberties of Koreans were being further curtailed. Land was steadily concentrated in the hands of Japanese landlords. The long-standing rule that no language but Japanese must be used in the schools was more strictly enforced. Dissidents were severely punished. Obeisance at Shinto shrines was required not only of Shintoists, but of Buddhists and Korea's 500,000 Christians. Some Christian mission schools closed rather than submit to this re-

quirement. In 1939, as Japan became more completely totalitarian, large appropriations were made for the suppression of "thought crimes." Public unrest grew, and in 1940 a "Korean independence army" was fighting the Japanese in China. Americans were charged with encouraging the rebellious spirit of the people. In 1940 the church was placed under strict governmental control, and many U.S. missionaries were evacuated. Early in 1941, 17 missionaries and church members were imprisoned because suspicious Japanese police saw something sinister in their use of the Bible verse, "It is the Father's good pleasure to give you the Kingdom."

Foreigners who did not leave at this time were subjected, after the war against the United States began on Dec. 7, 1941, to inhuman torture, Ambassador Joseph C. Grew reported upon his return to the U.S. in 1942.

Koreans actively sabotaged Japan's war effort. They killed 1,080 Japanese in a revolt in Feb. 1942 and caused extensive damage to military installations. In March they attacked the Japanese air base on Quelpart island, setting fire to four hangars, destroying two large fuel tanks and 69 aeroplanes. Throughout World War II they continued to dynamite power plants, blow up bridges and otherwise hamper troop movements, and destroyed Japanese factories and police stations.

Japan sought to put many war industries out of range of Allied bombers by locating them in Korea. The country was a valuable base of war supplies, largely because of its wealth of minerals.

In the Cairo conference, Nov. 1943, President F. D. Roosevelt, Prime Minister Winston Churchill and Generalissimo Chiang Kai-shek issued a communiqué, one paragraph of which was of direct concern to Korea: "The aforesaid three great powers, mindful of the enslavement of the people of Korea, are determined that in due course Korea shall become free and independent."

The Japanese naturally failed to make public this commitment in Korea. However, some weeks later the news was smuggled into the country by Koreans operating in China. Unfortunately the term "in due course" was translated as "in a few days." The same error was repeated when the provision was widely published in Korean papers after the entry of United States forces Sept. 8, 1945.

By agreement with Russia at Potsdam, U.S. control was limited to south Korea below the 38th parallel while the Russians occupied the country north of this line. A cleavage not only in territory but in policy was soon evident. While the soviet introduced a modified communism in northern Korea and imprisoned Japanese officials and their collaborationists, Lieutenant General John R. Hodge, commanding the U.S. zone, announced that Japanese administrators including Governor General Noboyuki Abe would retain office for the time being. This action was taken in the interest of order and stability. The U.S. force was strictly a military mission unaccompanied by sufficient civil advisers to attempt direct administration of the country, and Koreans were deemed too inexperienced to undertake this responsibility at once.

So great was the storm of protest from Koreans, whose hopes had been raised by the prospect of freedom "in a few days," that the action of General Hodge was countermanded on Sept. 11 by General Douglas MacArthur, who ordered that Japanese officials be replaced as rapidly as possible "consistent with the safety of operations." Abe and others were transferred to Japan to await trial as war criminals. However, the purge was not sufficiently complete

d, S. Occupation forces, led by the 7th infantry division, began formal occupation of Korea early in Sept. 1945. Koreans lined the street to welcome these veterans of bitter fighting in the Southwest Pacific

to satisfy Korean patriots. Liberty of the press was allowed, and the Koreans took full advantage of it to criticize U.S. occupation policy.

The most vocal political elements were a group of patriots under Kim Koo and Dr. Syngman Rhee which for many years had sought in vain to be recognized by the United States as Korea's government-in-exile, and the "Korean People's Republic," made up of members of Korea's underground movement together with communists and other leftists and enjoying wide support among the Korean peasantry. The latter faction was at once recognized by the soviets, but neither it nor the "government-in-exile," otherwise known as the "Korean provisional government" was permitted to assume administration in the southern zone.

These parties remained the chief bidders for power, but other parties mushroomed until there were more than 50. To aid the U.S. military government, General Hodge appointed a Korean advisory council of 11 members. This council was popularly criticized as made up of landlords and industrialists and headed by a former collaborationist with the Japanese, Kim Seung Soo.

New resentment was aroused in Korea by the report of the Moscow Conference of Foreign Ministers in Dec. 1945. It recommended that a joint commission of U.S. and soviet representatives should be established which should assist in the formation of a provisional Korean government in preparation "for the working out of an agreement concerning a four-power trusteeship of Korea for a period up to five years."

This provision was so much at variance with the Korean understanding of the previous promise of freedom "in due course" that serious riots broke out at once throughout the country. Secretary James Byrnes on Dec. 29 hastened to clarify the Moscow report by explaining that the trusteeship would be as short as possible and might be averted altogether.

During 1946 the country suffered seriously economically because of its division into two zones and the lack of full co-operation between the two occupation forces. The industrial north needed the products of the agricultural south, and vice versa. Negotiations led to a slight raising of the bars on Feb. 7, 1946, when a joint U.S.S.R.-U.S. communiqué announced that transportation between the two zones would be permitted. In reality, however, such intercommunication continued difficult.

In October, riots, food demonstrations and a railroad strike resulted in the death of 38 Korean police. The

critical shortage of rice was blamed upon the administration. Handbills distributed in Seoul read, "Down with American Imperialism." The Russians too were having trouble, and thousands of Koreans attempted to cross the border into the southern zone, while dissidents in the south sought to go north.

Fugitives from the Russian zone reported that the industries were being dismantled and the machinery shipped to Russia. The U.S. reparations commissioner, Edwin W. Pauley, was finally permitted to visit the soviet zone and reported these rumours lacking in foundation. He found the zone's heavy industry reasonably intact.

Failing to agree with the soviets upon the formation of a government for all Korea, the U.S. military government in Oct. 1946 approved an ordinance providing for an interim legislative assembly for southern Korea to consist of 90 members, 45 elected and 45 nominated by General Hodge. The assembly was constituted forthwith. General Hodge held the right to veto legislation, dissolve the assembly, or approve new members. The assembly, its powers thus limited, failed to satisfy political groups which, however, were unable to agree upon a constructive program. Dr. Syngman Rhee, now head of an organization known as the National Society for the Rapid Realization of Independence, barely escaped assassination, as did Lyuh Woon Hueng, chairman of the People's party and the Democratic National Front.

In December General MacArthur reported a wave of strikes and serious delay in industrial recovery. Three newspapers were listed as suspended, and a railroad strike was condemned as having been carried out with political motives "to discommode and discredit the U.S. forces in Korea." There was evidence of increasing sternness in dealing with disorderly elements. However, the report urged Koreans to assume more governmental responsibility and stated that the U.S. authorities would henceforth act only as advisers.

Preparation of the Koreans to solve their own problems was seen in the visit to the United States of six members of the Korean Educational commission to study methods of modern education, possibly Korea's greatest need. Of Korea's 4,892,418 children of school age, only 1,721,873 were in school. It was estimated that to educate all, 52,800 new teachers were needed. Korea had only 16 normal schools, and these could supply only some 2,000

teachers a year. With the removal of Japanese personnel, the urgent need of the country was the training of Koreans in industry, banking, commerce, government and the professions. As a first step, plans were completed before the end of 1946 to send 300 Korean students to the U.S. for advanced technical training.

Initiation rites for several hundred new members of the Association of Georgia Klans on Stone mountain, Ga., May 9, 1946. Proceedings to revoke the charter of the older Ku Klux Klan were instituted by the state of Georgia the following month

Krueger, Walter

Krueger (1881-), U.S. army officer, was born in Flatow, Germany, on Jan. 26, 1881. Taken to the U.S. as a child, he attended the Cincinnati Technical school from 1896 to 1898 and left school to enlist as a private at the outbreak of the Spanish-American war. He later saw action during the Philippine insurrection, on the Mexican border and during World War I. From 1921 to 1938 he filled various posts at army schools and on the general staff. Promoted through the grades, he became a brigadier general in 1986, major general in 1989, and lieutenant general in 1941. In 1941 and 1942 he commanded the 3rd army in the United States. When the 6th army in the Southwest Pacific was organized early in 1943, Gen. Krueger was sent to Australia to take command. He directed the U.S. invasion of New Britain in Dec. 1943 and the operations in New Guinea the following year. He also led the U.S. ground forces which took part in the landings on Leyte Island in the Philippines on Oct. 20, 1944, and in the Luzon invasion of Jan. 9, 1945. Krueger was named to the temporary rank of a full general in March. In Jan. 1946 he relinquished the command of the 6th army.

Krug, Julius Albert

Krug (1907-), U.S. government official, was born Nov. 23, 1907, in Madison, Wis. He received his M.A. degree at the University of Wisconsin in 1930. Krug was associated with the Federal Communications commission as a public utilities expert in 1936-37, was chief power engineer of the Tennessee Valley authority from 1938 to 1940, and chief power consultant of the Office of Production Management in 1941. He then worked with the War Production board and was appointed program vice-chairman of the WPB and director of the Office of War Utilities in Feb. 1943. After the Allied invasion of France, Krug, who had left the WPB to accept a commission as a lieutenant commander in the navy early in 1944, went to France to help restore public utilities there. When Charles E. Wilson resigned as executive vice-chairman of the WPB and chairman Donald M. Nelson was on a visit to China, Pres. Roosevelt called Krug back to the WPB in Aug. 1944 to assume the post of acting chairman. With Nelson's resignation the following month Krug became chairman. One year later Krug resigned. In March 1946 he succeeded Harold Ickes as secretary of the interior.

Ku Klux Klan

The Ku Klux Klan, which gradually had lost membership in the depression years, became an appendage of U.S. fascist groups during the decade 1937-46. In the first year of World War II, its membership, which was almost

altogether confined to the eastern seaboard, was associated closely with the German-American Bund.

A nucleus of membership remained in the south. Investigation into the activities of the Klan's imperial wizard, Hiram W. Evans, as agent for numerous companies selling road-building materials to the state of Georgia, led to an antitrust indictment and civil suit in the federal courts. Evans was superseded as imperial wizard. The organization was formally dissolved in 1942, after a series of outrages, including a fatal flogging, had been linked to the Oakland City (Georgia) Klavern of the Klan.

In 1946 the Klan reinstated its Georgia charter, and began active membership campaigns in the south, and in eastern and mid-western industrial centres. The southern campaign was directed against Negroes, while that in other sections stressed anti-Semitism.

By direction of Gov. Ellis Arnall, Georgia brought action to surrender and cancel the Klan's charter and to dissolve the corporation in June 1946. Other states took similar action, including Kentucky and New Jersey. Klan officials contended that the parent organization had been dissolved, that local Klaverns were autonomous, and that the unity of the organization was maintained wholly by voluntary state associations of individual Klans. Klan membership in 1946 was estimated at 65,000 by some observers, but spokesmen for the order offered figures varying from 150,000 to 400,000 and claimed a widespread distribution of Klaverns.

Kung, H. H.

), Chinese financier and statesman, Kung (1881was born in Taiku, Shansi province, of a family tracing its ancestry back 75 generations to Confucius. Educated in the United States, he took his bachelor's degree from Oberlin college in 1906 and his master's degree from Yale in 1907. He married Ai-ling Soong, one of the three famed sisters who were to play an important part in modern Chinese history (the others: Mme. Chiang Kai-shek and Mme. Sun Yat-sen). In 1931 Kung became a member of the Kuomintang Central Executive committee. He was made minister of finance and concurrently vice-president of the Executive Yuan in 1933. He probably owed his long tenure of office as minister of finance to the fact that he was more amenable to dictation from Chiang Kai-shek than his more brilliant but somewhat temperamental brother-in-law, T. V. Soong. In 1937, after a trip to Europe, where he was feted by the nazis, Kung went to the United States to negotiate loans for China. During 1937 and 1938 he acted as president of the Yuan to permit Chiang Kaishek to devote all his time to war problems. Chiang resumed the presidency in Nov. 1939 and Kung continued as vice-president and finance minister. In June 1944 Kung headed the Chinese delegation to the United Nations monetary conference. He was replaced as finance minister in Nov. 1944.

In May 1946 he resigned as vice-president and as governor of the central bank of China.

Kurusu, Saburo

Kurusu (1886—), Japanese statesman, was born in Yokohama and studied for a diplomatic career. He entered the foreign service in 1910 and served as consul in Chicago, New York city, the Philippines and Honolulu. He was named minister to Peru in 1928, and was director of the commerce bureau at the Japanese foreign office from 1932 to 1937, when he became ambassador to Belgium. Later, as ambassador to Germany, he signed the Rome-Berlin-Tokyo pact of Sept. 27, 1940. In Nov. 1941 he was sent to the U.S. ostensibly to assist Japanese Ambassador Nomura in a final peace effort. He started peace negotiations with President Roosevelt and Secretary of State Hull on Nov. 17, 1941; on Dec. 7 the Japanese launched their attack on Hawaii.

Kurusu retired from the Japanese diplomatic service in Feb. 1945.

Kyanite Minerals

This group of minerals includes kyanite and the closely related andalusite, dumortierite and sillimanite. Only kyanite was produced in any quantity in the United States during the decade 1937–46, but there were small outputs of andalusite and dumortierite. Extensive deposits of sillimanite in Georgia, South Carolina and North Carolina were a war discovery giving promise of possible commercial development.

Demand for kyanite continued to exceed output in the United States, and imports, mostly from India, generally exceeded output.

Supplies of kyanite during the years of World War II were as follows in short tons:

	Domestic Shipments	Imports	Total Supply	Stocks
1940	4,241	7,658	11,899	?
1941	8,335	14,285	22,620	?
1942	8,708	6,524	15,232	9,485
1943	9,651	9,972	19,533	10,889
1944	?	5,735	?	8,618
1945	;	14,554	3	8,000

Kyanite is used as a high grade refractory and andalusite, dumortierite and sillimanite are used in making spark plug cores. (G. A. Ro.)

Labour Party, Great Britain

During the years preceding World War II, the British Labour party took a strong line in support of the policy of collective security; in 1938 it opposed the Munich settlement. It worked for an understanding with the soviet union, based on the policy of collective security through the League of Nations, but it rejected all proposals for a united front with the other working-class parties or for a popular front on a broader basis to oppose fascism, despite considerable support for these movements among its members. In 1939 it had undoubtedly a body of popular backing considerably in excess of its strength in parliament.

On the declaration of war in 1939 the Labour party, despite its disapproval of the Chamberlain government, at once pledged its full support, but refused to enter into coalition under Neville Chamberlain's leadership. After the disasters of the early months of 1940 it was largely responsible for the fall of the Chamberlain government and it entered into the new coalition government formed under Winston Churchill. Clement Attlee became deputy prime minister, and Ernest Bevin minister of labour and national service; other Labour members prominent in the new government included Herbert Morrison, Arthur Greenwood and Hugh Dalton. Attlee and Greenwood were members of the war cabinet, and were soon joined by Bevin. Morrison, though a member of the government from 1940, joined the war cabinet only in 1942. Sir Stafford Cripps, who also became a member in that year, was still outside the Labour party, from which he had been expelled in 1939 on account of his agitation for a united front with the Communist party. He rejoined only shortly before the general election of 1945.

In the wartime coalition government the Labour ministers played a leading part, especially in the direction of home affairs. When the European war ended, the Labour party was prepared to remain in the coalition for a limited period; but Churchill insisted either that it should pledge itself to remain until the war in the far east ended, or that the coalition should be broken up at once. Then followed the hurried general election of 1945, in which the Labour party scored an unexpectedly handsome victory, winning 394 seats in a parliament of 640. Clement Attlee became prime minister, with Bevin as foreign secretary, Dalton as chancellor of the exchequer and Morrison as lord president of the council, with a co-ordinating position in home affairs. Aneurin Bevan went to the ministry of health and Sir Stafford Cripps to the board of trade. The incoming government had appealed to the country on an immediate program, Let Us Face the Future, in which it pledged itself during the life of parliament, if it were returned to power, to a considerable, but limited plan of nationalizing key industries and services (Bank of England, coal mining, public utilities, steel and inland transport) as well as to the maintenance of necessary controls, the pursuit of a policy of full employment, the Beveridge plan of social insurance, comprehensive development of a national health service, an active housing plan based mainly on municipal building and the effective control of land use, and location of industry by drastic reforms of land law and of town-planning legislation. In external affairs it pledged full support to the United Nations organization, then being set up, freedom for India and a forward policy of colonial development aiming at self-government. During its first year of office it carried through a large instalment of this program. The Bank of England and the coal mines were

Harold Laski addressing the national Labour party conference at Bournemouth, England, in June 1946. Delegates to the conference took stock of the party's achievements after ten months in power and considered matters of future policy in domestic and foreign affairs

nationalized; a new National Insurance act based on the Beveridge plan was passed; family allowances came into operation; a National Health Service bill was carried through the house of commons and in India, after a failure to achieve agreement between Hindus and Moslems, a government based on the Congress party was installed in power. A beginning was made with new town and country planning measures by the New Towns act of 1946; in housing and food, the two most difficult domestic problems, the government did what it could in face of the acute shortage of building labour and of the serious world food crisis of 1946. The course of by-elections showed that during its first year of office the Labour government had lost little, if any, of its popularity. The legislative program for 1946-47 included prison reform, comprehensive legislation on land use and the nationalization of electricity, gas and inland transport.

Labour party membership fluctuated considerably. Af-

filiated trade union membership was affected up to 1946 by the Trade Unions act of 1927, passed after the general strike of 1926. This act substituted "contracting-in" for "contracting-out" as the basis of trade union political membership (i.e., a member had to sign a form asking to pay instead of one asking not to pay towards the union's political fund); and it also prevented civil servants' unions from belonging to the party. The repeal of the act in 1946 was expected to lead to a sharp increase in membership. Individual membership of the local parties was rising up to 1939, but fell off greatly during the war, owing to the call-up for the forces and to much internal migration. It was recovering fast in 1946, and many new branches of the party were being formed, especially in country districts. By the middle of that year it had reached nearly 500,000, after being down to about 200,000 in 1942. (See also Great Britain and Northern Ireland, UNITED KINGDOM OF; SOCIALISM.)

(G. D. H. C.)

Labour Unions

During the ten years beginning in 1937, the U.S. labour movement went far in unionizing all branches of U.S. industry. Its membership multiplied at an unprecedented rate, rising from less than 5,000,000 in 1937 to more than 12,000,000 in 1946. The great majority of the traditionally nonunion industries, such as steel, automobiles and food production, were unionized. Labour organization spread not only to wage earners, but also to all classes of salaried or white-collar workers, causing the rise of large unions of clerks, salesmen, technicians and engineers, and public servants.

Within the labour movement there arose a new federation of labour to challenge the supremacy of the A.F. of L. The Congress of Industrial Organizations (C.I.O.), began as a more or less informal insurgent movement within the A.F. of L., started by such established leaders as John L. Lewis and Sidney Hillman and the leaders of the new unions of automobile and rubber workers. The A.F. of L. took steps to discipline the insurgent unions, which thereupon withdrew from the federation. The C.I.O. thus became an independent organization. It began organization campaigns, particularly among the mass-production industries. Its successes in organizing steel and automobile companies were so great that it achieved by 1940 the status of a permanent federation of labour, claiming more than 4,000,000 members and challenging the jurisdiction of the A.F. of L. throughout U.S. industry.

The rise of organized labour during these years was a direct effect of public policy. Arising mainly out of experience with the prolonged and devastating depression of 1929-33, there were new views of economic policy in general, and labour policy in particular. The core of the views as to labour policy was the belief in rising rates of wages as the source of expanding purchasing power and stable business conditions. Hence it was deemed to be wise public policy to raise wages by the more extensive practice of collective bargaining and by minimum wage laws.

The federal government therefore embarked upon an ambitious program of labour legislation. Beginning in 1932 with the Norris-LaGuardia anti-injunction act, which aimed to free labour unions from traditional curbs, and in 1933 with Section 7a of the National Industrial Recov-

ery act, which aimed to encourage the unionization of industry, congress passed and the president signed on July 5, 1935, the National Labor Relations (Wagner) act.

This act was the cornerstone of the new labour policy. Its purpose was the promotion of unions and collective bargaining. It was a far-reaching statute not only in its provisions, but in the power that was granted to the act's administrative agency, the National Labor Relations board. The Wagner act was a unique labour statute in that it specified in detail the classes of unfair practices which were forbidden to employers and the conditions under which unions could be chosen to represent employees for bargaining purposes.

The full effect of the Wagner act was not felt until the constitutionality of the law and the powers of the NLRB were defined by the U.S. supreme court. This was done in five decisions announced by the court on April 12, 1937. These decisions established the authority of the federal government to regulate labour conditions in manufacturing establishments and confirmed the constitutionality of the Wagner act on unusually broad grounds. From that time on the Wagner act and its administration became potent influences in the growth of organized labour. The agencies of government not only removed obstacles in the path of unions but did all they could to promote organization.

To the influence of legislation were added the conditions of war. World War II, like its predecessor, required enormous production and industrial peace. The government established special labour agencies to deal with potential and actual labour disputes. On March 19, 1941, the president created the National Defense Mediation board. This board disbanded in December because of its inability to handle a closed-shop dispute in the coal industry. Its successor, the National War Labor board, was set up on Jan. 12, 1942. (See WAR AND DEFENSE AGENCIES.)

Conditions of labour shortage and the friendly attitude of the War Labor board contributed further to union growth and power. By the end of the war, the unions had amassed an additional 4,000,000-5,000,000 members. Organized labour found it not only easy to organize, but it

"Look Out! Those Are Boomerangs," Bishop of the St. Louis Star-Times cautioned labour in 1944

New York delegates of the C.I.O. arriving at Washington, D.C., to support the Kilgore bill in 1945. Backed by Pres. Truman, the bill provided maximum unemployment benefits of \$25 weekly for 26 weeks

received concessions from the NWLB which added to its permanent strength.

When the war was over, the combination of strong unions and large demands for concessions in working conditions produced the first postwar labour crisis. The year 1945-46 was one of the most troubled in the history of U.S. labour relations. The numbers directly affected by strikes exceeded all previous records. A strike of locomotive engineers and railroad trainmen caused the president to end the strike by a radio appeal to the members of the unions. Congress reacted to the disturbances by adopting with large majorities drastic amendments to the Wagner act and other changes in the basic labour law of the United States. This attempt to rewrite the law of trade unions was the first serious effort in this direction since the passage of the Wagner act in 1935. The proposed law, the Case bill, was vetoed by the president, but it had won large support throughout the country.

Much of the strength of organized labour in these years was derived not only from favourable public policies but also from the organized political power of labour. Although the A.F. of L. had developed an influential labour lobby in Washington and state capitals, it remained for the C.I.O. to undertake to mobilize the political power of organized labour. Among other things the C.I.O. established a political arm, the Political Action committee (q.v.), to exert the maximum political influence of labour in national and local election. The political activities of the C.I.O. were considered to have given effective assistance to the Democratic party during the years of the Roosevelt administration.

The turn in both the political and economic power of organized labour came probably in 1946. The memory of the sit-down strikes of 1936–37 and the wave of postwar strikes of 1945–46 caused a strong reaction against unions in public opinion. There was more frequent and more general questioning of the soundness of a national labour policy which produced such strong unions and so much labour trouble. Largely because of dissatisfaction with the labour situation, the Republicans swept the congressional elections of 1946. (See also Business Review; Communism; Law; National Labor Relations Board; Strikes and Lockouts.) (L. Wo.)

Labour Unions in Great Britain.—During the period 1937–46 there was a considerable rise in the membership of the British trade unions, and an even more considerable increase in their effective strength. In 1925, the total membership was about 5,500,000. Right up to the outbreak of World War II, the trade unions were still suffering from the after-effects of their defeat in the general strike of 1926. The total fell to 4,392,000 in 1933. Thereafter, it gradually climbed back to 6,234,000 in 1939, and by the end of 1944 total membership had reached 8,024,000. After that there was a further rise, probably to about 9,000,000 in 1946.

The great increase in the employment of women's labour during the war years led to a sharp rise in female membership, from 925,000 in 1938 to 1,805,000 in 1944. The total female working population of Great Britain declined from about 7,500,000 at the wartime peak to about 5,700,000 by the middle of 1946, or, exclusive of women in the armed services, from about 7,000,000 to about 5,500,000. Nevertheless, some lasting increase in the number of women trade unionists seemed probable, though the decline in numbers employed in the cotton industry, for-

Tenth annual convention of the United Automobile Workers of America, at which Walter P. Reuther succeeded R. J. Thomas as president of the militant C.I.O. union on March 27, 1946

Striking London dock workers presenting a show of hands to signify support of union policy during the most widespread postwar strike of 1945 in Great Britain

merly the principal women's industrial occupation, was certain to be permanent. Shortage of manpower in industry generally, and the desire of more women to have independent incomes would tend to swell the numbers employed in industry; but a part of this increase would be offset by a fall in the numbers employed in domestic service. As domestic servants were still almost entirely unorganized, the effect would be to bring a larger proportion of employed women within the range of trade union influence.

Structurally, the trade union movement underwent little change from 1937 to 1946. The most important changes were consolidation of the Miners' federation, made up of a number of independent district unions, into the National Union of Mineworkers, and the opening of the Amalgamated Engineering union, the largest society of skilled workers in manufacturing industry, to female members. There was some tendency towards closer federal action between the unions in different branches of the same industry, in particular in engineering, where the breach between the A.E.U. and the Confederation of Shipbuilding and Engineering Trade unions, including the smaller societies and the main body of the less skilled workers, was healed. The other important amalgamation was that of the two main unions catering to distributive workers-the National Union of Distributive and Allied Workers, which had its main strength among Co-operative employees, and the National Amalgamated Union of Shop Assistants, Warehousemen and Clerks, which was strongest in the big private department stores and multiple shops. The new body became known as the National Union of Distributive, Shop and Allied Workers.

Established methods of collective bargaining continued in force throughout the war; but when the parties failed to agree the matters in dispute were referred for settlement by arbitration, usually by the National Arbitration tribunal set up by the government to develop the peacetime

voluntary arbitration activities of the industrial court (set up in 1918). Inevitably, during the war, the government became involved in the adjustment of wages questions, especially in coal mining and in agriculture; but, in general, matters were left in the first instance to ordinary trade union bargaining, and the National Arbitration tribunal or the state department concerned came in only in the last resort. Smooth working was facilitated during the war by the creation of a National Industrial Advisory committee representing the Trades Union congress and the principal employers' organizations; and similar advisory committees were set up in the main departments which were concerned with labour questions. Especially after the formation of the coalition government in 1940, trade unions were steadily consulted in all matters affecting their members' interests; and many trade unionists became temporary civil servants and played an active part in the adjustment of labour difficulties. Smooth working was also helped by the setting up in war factories of joint production committees, to advise on questions of output and workshop organization; and this system seemed likely to become permanent. The wartime advisory committees of trade unionists and employers were also reconstituted on a peacetime basis in connection with the main departments of government.

Throughout the war years strikes were few, and mostly short and unimportant. They were usually "unofficial," i.e., called without the sanction of the trade union executives, and arose mainly out of local grievances. From 1939 to 1945, the average number of days lost annually as a consequence of trade disputes was well under 2,000,000, and the average number of workers involved well under 500,000. There was a small rise in strike activity in 1944 and 1945, but it was not large enough to be significant or to cause any serious loss of production. Indeed, after 1926,

the severity of strikes in Great Britain was much less than it had been previously; and the vast majority of differences in peace as well as in war were settled by negotiation without stoppages of work.

From 1927 to 1946, the Trade Unions and Trade Disputes act, passed by the Conservative government as a sequel to the general strike, was in force. This act imposed severe limitations on strike activity, especially on picketing, and created a class of "unlawful" strikes which it was an offense to foment or to assist. These were strikes extending beyond a single trade or industry where they were also designed to coerce the government-a not too clear category, which was in fact never put to the test in the courts. The act of 1927 also prevented unions of workers in the national service from affiliating to either the Trades Union congress or the Labour party, and limited political action by trade unions, substituting "contractingin"-i.e., signed indication of willingness to subscribefor "contracting-out" as the basis of trade union connection with the Labour party. During the existence of the coalition government, repeated attempts were made to get the act modified by agreement; but the Conservative party would not consent to this, and consequently the entire act was repealed in the spring of 1946, and the law put back to where it stood before 1927. The trade unions in the post office and the largest unions of civil servants rejoined the Trades Union congress, and most of them would probably resume connection with the Labour party as well.

During the summer of 1946, there was much discussion in the British press of an alleged desire of the trade unions to enforce the principle of the "closed shop." Much of this discussion was confused because of a failure to distinguish between two quite separate issues that were involved. The trade unions had, of course, always aimed at "100% membership," and in some cases-e.g., the miners -had attempted, when strong enough, to make trade union membership a condition of employment, as it actually had been in most of the coal fields before the defeat of 1926. This policy, however, had not usually been interpreted to mean that all employees in an industry must belong to a single union, and in practice unions had usually recognized one another's cards fairly freely. The second issue was that which arose out of certain breakaways from established unions, resulting in the formation of small, independent unions which the Trades Union congress and the established unions refused to recognize. The trade unions affected, particularly the Transport and General Workers, endeavoured to secure exclusive recognition, for the grades they mainly covered, and in some cases the enforcement of membership as a condition of employment, as a means of dealing with these "breakaways"; but it was made clear at the Trades Union congress of Oct. 1946 that there was no intention generally to enforce the "closed shop," or to insist on membership of a particular trade union. It had, of course, to be borne in mind that there was in Great Britain no such rift as existed in the United States between two rival trade union movements. The breakaway unions did not stand for any common principle or policy, and were of little numerical strength or importance.

The Trades Union congress, which included all the important unions of manual workers and a considerable number of those formed among nonmanual workers, strengthened its position as the central body representing the trade union movement as a whole. In 1946 it had an affiliated membership of 6,671,120, organized in 192 unions, as compared with 4,669,000, in 170 unions, in 1939. The

total number of unions included in the government returns was about 940, but this included many very small local societies, some of which were in the Scottish Trades Union congress. The T.U.C., together with the Labour party and the Co-operative union, formed the National Council of Labour, which was the general co-ordinating body for the entire movement. It had been strengthened by the adhesion of the Co-operative union in 1942. Trade union membership of the Labour party amounted in 1945 to 2,510,000, as compared with 2,214,000 in 1939. This figure was expected to be considerably increased as a result of the return of men from the forces and the repeal of the Trade Unions act of 1927.

Lacrosse

One of the greatest teams in world lacrosse history occupied the spotlight at the beginning of the decade 1937–46, with 33 consecutive victories over some of the best aggregations the sport had produced. This was the renowned Mt. Washington club of the United States. But its master revealed itself in 1937 in the form of the Baltimore Athletic club which defeated Mt. Washington in a game at Baltimore, Md., to win the United States national open lacrosse title in a great upset.

In the same year the United States Intercollegiate Lacrosse association sponsored and managed a composite All-American team in a series of exhibition games in England during the summer. The U.S. team met with a measure of success against some English opponents but found others too strong. The exhibition series wound up with the U.S. squad having broken about even on games won and lost. The club teams playing in Canada, England and the United States all reported good seasons.

In 1938 Mt. Washington headed the list of clubs, nosing out the formidable Baltimore A.C. twice to establish a clear claim to the club championship. Subsequently in the open championship, St. John's of Annapolis defeated Mt. Washington, thus leaving that situation in something of a muddle. In Great Britain the game enjoyed another banner year in 1938, and while the all-star U.S. ten did not visit England as they had in 1937, the Britons found excellent competition among their own numerous university and club leagues. The Canadian branch of the sport flourished as usual with the dominion universities setting the pace.

Johns Hopkins university, Baltimore, Md., long a power in the sport, reached its peak in 1940 by defeating the mighty Navy. Maryland, completing an undefeated season, inflicted the only loss Johns Hopkins suffered, 7–6.

Navy subsequently declined. Maryland, Johns Hopkins and Princeton were at the top of the collegiate heap. Princeton, though losing to Maryland and Johns Hopkins, beat all other rivals. Swarthmore, playing nearly in its class, was undefeated and won the Pennsylvania league championship. Duke and North Carolina were the best in the Dixie league. The All-Star northern team beat the All-Star southern team for the first time in the history of this annual meeting, 6–5.

The year 1941 in lacrosse centres was marked by the return to top strength of Johns Hopkins. At the same time

one of the surprises of the year was the unexpected strength of Dartmouth and Syracuse. Johns Hopkins, one of the oldest lacrosse centres in the world, came through an undefeated season and crowned this achievement by defeating the Mt. Washington club, the first time the latter had been set back in two years. The game for the first time spread to the U.S. middle west. Kenyon college, Gambier, O., Oberlin, Oberlin, O., and Michigan put teams on the field, and their performances were well received by the public. The annual north-south lacrosse game was won by the southerners with a 7 to 6 victory.

Fielding the finest team in its history, Princeton university won the intercollegiate lacrosse championship in 1942 and thus wrested the title from the state of Maryland for the first time in many years. The Tigers' 12-10 victory over the University of Maryland and their 4-2 decision over Johns Hopkins of the same state were the highlights of the season.

The annual north-south game in Baltimore resulted in a 6-4 victory for the north, but in a special abbreviated game two weeks later in New York, the south was the winner, 5-1.

Like most college sports which had been affected by drafting of men into military service, lacrosse in the United States slowed down for the duration of World War II. This increased the interest in women's lacrosse, which in 1942 was represented by teams from Boston, Baltimore, Philadelphia, Westchester, New York, and a few cities in the middle west where the game was being introduced at girls' colleges.

In 1943 the two best teams in the country were Navy and Maryland. On the distaff side, Philadelphia clinched its tenth National Women's Lacrosse association tournament title by defeating the Etceteras 12–2. The latter squad was made up of college girls.

The U.S. military academy placed ten men on the 1944 All-America team and the same school won the Wingate trophy presented to the leading college team. Navy and Stevens Tech, Hoboken, N.J., received honourable mention for that award and each of those schools placed two men on the All-America team. The annual William Schmeisser Memorial trophy, awarded to the outstanding defensive player, went to Fred Allner, of Cornell and formerly of Princeton. Cornell also placed Brooks Tunstall on the All-America team.

The 1945 season, returning to normal, saw Army and Navy tie for the Wingate trophy.

The 1946 U.S. intercollegiate championship was won by Navy. The women's national championship went to a team from Philadelphia, Pa., which defeated Westchester, N.Y., by a score of 6 to 5.

In Canada, box lacrosse made a strong comeback with the return to action of the New Westminster Adanacs, the team that won the Mann cup in 1939 but which had been out of play because of the war. The Mann cup for 1945, emblematic of Canada's lacrosse supremacy, was won by the Vancouver Burrads who defeated the St. Catherine's Athletics.

(T. J. D.)

La Follette, Robert Marion, Jr.

La Follette (1895—), U.S. politician, was born Feb. 6, 1895, in Madison, Wis., son of the elder Robert La Follette, former governor and senator from Wisconsin and independent presidential candidate in 1924. The younger La Follette studied at the University of Wisconsin but left school because of illness. After recovering his health

he decided to become his father's secretary instead of continuing his studies. In 1925 he ran for the seat in the U.S. senate left vacant by the death of his father and was elected by a substantial majority. He was re-elected in 1928. In 1934 La Follette split with the Republican party and, running as candidate on the Progressive ticket, was again elected in the November voting. Named to the senate finance committee in Jan. 1930, he sided with the liberal elements and frequently made common cause with George Norris, William E. Borah, Robert F. Wagner and Smith Brookhart.

In 1940 La Follette lost much of his New Deal support by his unalterable noninterventionist stand; his position was that the United States should not enter any war except in the case where it or any of its territorial possessions or any other western hemisphere nation was attacked.

Upon his re-election to the senate in 1940, he continued his energetic attacks against the administration's foreign policy. In March 1946 the Progressive party of Wisconsin voted by an overwhelming majority to rejoin the Republican party. However, the Republicans failed to nominate La Follette for the senatorial candidate in the 1946 elections, picking Joseph R. McCarthy instead at their convention on May 5, 1946.

La Guardia, Fiorello Henry

), U.S. politician, was born in La Guardia (1882-New York city on Dec. 11, 1882. From 1901 to 1906 he served in U.S. consulates in Hungary and Austria, and returned to the U.S. to graduate from New York university law school in 1910. As congressman from New York from 1917 to 1921 and again from 1923 to 1933, he appeared as a militant liberal. In 1983 he was elected mayor of New York city and was re-elected in 1937 and in 1941. He was regarded as a reform candidate and received the support of the American Labor party of New York as well as of the Fusion party. In Aug. 1940 President Roosevelt appointed him chairman of the U.S. section of the Canada-U.S. joint board of defense, and in May 1941 he was named director of the Office of Civilian Defense. La Guardia resigned the directorship in Feb. 1942. In Nov. 1945 his term of office as mayor expired. He succeeded Herbert Lehman as director general of the United Nations Relief and Rehabilitation administration in March 1946.

Land, Emory S.

Land (1879-), U.S. naval officer and government official, was born Jan. 9, 1879, in Canon City, Colo. He was graduated from the University of Wyoming, Laramie, Wyo., in 1898, from Annapolis in 1902, and from the Massachusetts Institute of Technology, Cambridge, Mass., in 1907. During World War I, he served on the staff of Adm. William Sims in London. He was associated with problems of naval construction, serving as chief of the navy's bureau of construction and repair from 1932 to 1937. Made a rear admiral when he retired from the navy in 1937, he was named commissioner of the U.S. maritime commission, and succeeded Joseph Kennedy as chairman in 1938. Soon after the U.S. entered World War II, Adm. Land was also made administrator of the War Shipping administration. In this dual capacity he had control of the requisitioning, purchase, use and operation of all

Land Banks

See FARM CREDIT ADMINISTRATION.

Lange, Oscar Richard

Lange (1904—), Polish statesman, was born in Tomaszow, Poland, July 27, 1904. He received his LL.M. degree from the University of Cracow in 1926 and his LL.D. in 1928, becoming a lecturer in economics and statistics at that institution in 1931. He later joined the Socialist party. Lange went to the United States in 1934 as a fellow of the Rockefeller foundation and studied at Harvard university, Cambridge, Mass., and at the University of Minnesota, Minneapolis. In 1936, he became lecturer at the University of Michigan, Ann Arbor. After a brief trip to Poland, 1936-37, he returned to the U.S., joined the faculty of the University of Chicago in 1938 as assistant, becoming a full professor of economics in 1943. In the latter year, he also received his full U.S. citizenship papers.

An ardent opponent of the policies of the Polish government-in-exile in London, he supported the thesis of establishing a government that would be friendly and not antipathetic to the soviet union. In 1944, he visited Stalin in Moscow and discussed the Polish question. In the summer of 1945, Lange was offered the post of Polish ambassador to the U.S., he went to Poland, relinquished his U.S. citizenship and returned to Washington in December as the Polish envoy. He also was Poland's delegate to the U.N. security council sessions that opened in March 1946 in New York city.

Languages

It was hardly surprising that the conditions obtaining generally before the outbreak of World War II should be such as to inhibit original work in the linguistic field. Such was the case and, indeed, many well-established linguistic undertakings had to suspend activity for the greater part of the period 1937–46. Some institutions closed down altogether; others became temporarily inactive.

Even before World War II, the civil service commission in Britain and similar bodies in other lands were forming consultative committees of linguists to advise on textbooks and methods; and in the war the need was keenly felt for guidance as to the instruction of officers and men destined to serve in remote zones. Standard works from all the presses of the world were reproduced by photolithography as the quickest way to reach the desired end. This practice, however, resulted in no new work being undertaken.

So far as linguistics proper was concerned, the most outstanding achievement was the work done by Prof. Alexander Johannson of the Iceland university, Reykjavik, on the gesture origin of human speech. This was available in 1946 only in Icelandic, though with the co-operation and parallel researches of Sir Richard Paget, the English-reading public was soon to have an opportunity of reading the amazing results of Prof. Johannson's experimental work.

Scattered islands of activity kept up their efforts during the war years, notably Sweden and southwest China. In Sweden, Prof. Bernhard Karlgren completed his monumental Grammata Serica, a thoroughgoing examination of Chinese characters and word forms from an exhaustive analysis of ancient Chinese texts. Karlgren's output enhanced the reputation of Sweden in sinological achievement. In southwest China, the philological section of Academia Sinica continued its researches into Chinese dialects and the relation of Chinese to other members of the Siamese-Chinese family of languages. The war years did indeed make some difference to this work but it did not cease and several fine monographs attested its value.

There was considerable activity in Baltic languages. Russian dictionaries of Baltic tongues appeared; translations of Shakespeare, Sophocles and Plautus were made into Lettish and Lithuanian, as well as into Finnish and Estonian. In the U.S.S.R. the Caucasian languages (notably Georgian and its dialects) received much attention from competent scholars and the new publication Georgica printed papers of outstanding merit and importance. The new Turkish, spelled in Roman characters, produced the first complete translation of the dialogues of Plato into that language, concurrently with the Adventures of Arsène Lupin and the crime novels of Edgar Wallace.

In the countries most actively engaged in war, linguistic activity was mainly confined to the teaching of servicemen, but in classical studies brave efforts were made to keep research going. The Classical association of Great Britain held its annual meetings throughout the period. The Loeb Classical library even managed to produce several new volumes and reprint some of the more important ones which had long been out of print. Even more remarkable was the achievement in this field of study of the Guillaume Budé association of France which, throughout the German occupation, continued to issue first-class texts of Greek and Latin classics.

Throughout the war Russian linguists continued their researches into north European and Asiatic languages and in 1945-46 came the news that new Chinese, Mongolian and Yakut dictionaries were nearly ready and that first translations into Russian of some of the early Chinese philosophers (notably Kuan Tzŭ) would soon appear.

Few international conferences of philological interest could be held because of wartime travel restrictions, but the United Nations Educational, Scientific and Cultural organization had in 1946 already held a preliminary meeting of linguists and translators for the purpose of examining the possibility of making available in translation outstanding works of international cultural importance. In the summer of 1946 a conference on the teaching of eastern languages was held in Oxford. (See also Anthropology.)

Lard

The United States had a plentiful supply of lard during the early 1930s, but production declined to a low point 815

in 1935, when the per capita consumption was only 9.6 lb. compared with 14 lb. in 1932 and 1933. This decline simply reflected the decrease in hog production, since lard is a by-product of pork slaughter and varies in almost direct relation with hog numbers. As hog production increased after 1940, the lard output expanded. The shortage of all imported types of vegetable fats and oils became increasingly acute in 1941, and lard was in great demand. Military, lend-lease and civilian competition soon exhausted stocks, which fell from 186,511,000 lb. in Dec. 1941 to only 91,333,000 lb. a year later. By 1942 the production was double that of 1935, and the high record was reached in 1944, when the total was 3,215,000,000 lb. Of this total 2,034,000,000 lb. were consumed at the rate of 15.7 lb. per capita.

As the price of pork rose, the packers trimmed the pork less carefully, and the output of lard did not keep increasing at the same rate as pork production. The relative lard yield was low through 1943. In early 1944 the yield was estimated at 130 lb. of pork and 30 lb. of lard per hog. In the later months of that year the average production of lard per hog slaughtered was 35.8 lb. The supply increased from the record of 1944. Stocks were at a high point at the end of the year, amounting to 374,000,000 lb. As hog slaughter declined, the production of lard dropped through 1945 and 1946.

Production of Lard in United States, 1937–46 (In millions of pounds)

1937						1942.					
1938						1943 . 1944 .					
1940		-		٠	2,343	1945.					2,675
1941					2.281	1946 .					2,850

Government purchases of lard for lend-lease and export amounted to 326,000,000 lb. in 1941, 654,000,000 lb. in 1942, 882,000,000 lb. in 1943, and 809,000,000 lb. in 1944, then declined to 226,000,000 lb. in 1945. Large government stocks were released, and the end of lend-lease in Aug. 1945 reduced the export demand, leaving more for civilian use. The price of lard did not advance during the decade 1937-46 as did the price of butter and other cooking fats. Lard averaged 17 cents per lb. at leading cities in 1937 and advanced to 36 cents in 1946, the high point. At the same time margarine rose from 19 cents per lb. to 25 cents in 1946 and butter from 40 cents to 83 cents per lb. in 1946. The government ordered about 5% of the live-weight slaughter of hogs set aside for government purchase in 1945, and in May 1946 the percentage was increased to 6%. The increased supply was required for relief needs. World production of hogs being low, the demand for pork and lard was expected to continue high from the United Kingdom and European countries for two or three years. Lard exports were at the low total of 162,000,000 lb. in 1937, increasing to a high of 921,000,000 lb. in 1944, then dropping to 550,000,000 lb. in 1945 and declining still further in 1946. While there was complaint from civilians on the scarcity of lard after 1940, the rate of consumption was higher than the prewar 11 lb. per capita, when it reached 14.5 lb. in 1943 and 13.8 lb. in 1944. (See also Hogs; MEAT; VEGETABLE OILS and ANIMAL FATS.) (J. C. Ms.)

Largo Caballero, Francisco

Largo Caballero (1869-1946), Spanish politician, born of poor parents, went to work at the age of ten in the

coal mines and later became a stonemason and union organizer. He was one of the revolutionary Spanish leaders responsible for the dethronement of King Alfonso XIII and the creation, in 1931, of the Spanish republic, in which he became minister of labour and later minister of public works. In 1934, a more conservative Spanish government objected to Largo Caballero's militancy and tossed him in prison, where he spent 13 months before he was tried and finally acquitted. In 1936, when Gen. Francisco Franco launched the rebellion that started the Spanish Civil War, Largo Caballero immediately joined the Spanish Republican forces and fought on the Guadarrama front. In Sept. 1936 he became the first socialist premier of the Spanish republic and concurrently held the post of minister of war. However, his militant left wing socialism did not meet with the approval of the moderates in the Popular Front coalition and he was replaced as premier in March 1937 by the less extreme Juan Negrin. Toward the close of the civil war in 1939, Largo Caballero fled across the border to France, following which he was tried in absentia and sentenced to loss of citizenship, banishment and confiscation of property.

After the collapse of France in 1940, he disappeared but turned up again in Sept. 1945, at which time he said he had been detained in a German prison camp near Nuembers.

He died in Paris, March 23, 1946.

Larynx

See Ear, Nose and Throat, Diseases of.

Laski, Harold J.

), British socialist and political scien-Laski (1893tist, was born June 30, 1893, in Manchester, Eng. He studied at New college, Oxford, and lectured at McGill university, Montreal, from 1914 to 1916, at Harvard from 1916 to 1920, and at Yale in 1919-20. He joined the faculty of the London School of Economics in 1920. Long regarded as one of the British Labour party's most lucid expounders of socialist doctrine, he became chairman of the party executive committee in 1945. During the British electoral campaign, after the end of World War II in Europe, conservative newspapers painted the socialist leader as a "deep-dyed red" and asserted that he dominated the Labour party as a "one-man brain trust." Laski, as a matter of fact, enjoyed no real power in the British Labour party; the executive committee's authority was restricted to discussion of problems, and had little influence beyond making recommendations. After Labour's victory in the elections of July 1945, Laski, who was somewhat to the Left of the party, was not always a reliable official spokesman. In June 1946, he was succeeded by Philip J. Noel-Baker as party chairman.

Among Laski's later publications were: The State in Theory and Practice (1933), American Presidency (1940), Reflections on the Revolution of Our Time (1943), and Faith, Reason and Civilization (1944).

Latvia

From 1918 to 1940, Latvia was a republic, on the eastern shore of the Baltic sea, bounded on the north by Estonia, on the east by the U.S.S.R., and on the south by Lithuania. Its area comprised 25,395 sq.mi., thus making it larger than Denmark, Switzerland, or Holland. Chief towns (population figures 1935 census): Riga (cap., 385,063), Liepaja (57,098), Daugavpils (45,160), and Jelgava (34.099). According to the 1935 census the racial composition of the total population of 1,950,502 was: Lettish, 1,472,612 (75.5%); Russian, 233,366 (12%); Jewish, 93,479 (4.8%); German, 62,144 (3.2%); Polish, 48,949 (2.5%); others, 39,952 (2%). The census of 1930 gave the religious denominations of Latvia as: Lutherans, 56.6%; Roman Catholics, 23.7%; Orthodox, 8.9%; Old Believers, 4.8%; Jews, 4.9%; others, 1.1%.

President, from April 11, 1936, and prime minister from March 17, 1934, until the Russian occupation of June 16, 1940: Karlis Ulmanis. Prime ministers: August Kirchensteins (June 18, 1940–Jan. 1941); Vilis Lacis (after Jan. 1941).

The Ulmanis Regime.—By a coup d'état in May 1934, the prime minister, Dr. Karlis Ulmanis, had assumed complete power, though President A. Kviesis remained as nominal head of the state until his term of office expired in April 1936. Previous to this, the Saeima, or Latvian parliament, consisting of 100 members, had had 25 political parties, and cabinets had changed every few months.

The rule of Ulmanis from 1934 to 1940, when it was ended by the Russian invasion and annexation of Latvia, was a dictatorship, but it was authoritarian and not totalitarian. It was not dominated by an ideology as in fascist Italy, national socialist Germany or communist Russia; neither did it have a secret police on the model of the Gestapo or N.K.V.D., nor any concentration camp. But it did restrict the rights of minorities.

A decree in June 1934 prescribed Lettish as the sole written or spoken language of all state and communal services, except in districts where at least half the population had been registered in the last census as speaking a language other than Lettish.

On Jan. 1, 1936, a new decree set up state chambers of trade and of industry and commerce. This decree aimed at dissolving other economic organizations, such as the German guilds. As a result, an anti-Latvian press campaign was conducted in Germany, and on Jan. 22, 1936, the German minister called on Ulmanis, who, however, refused to recall the decree. In April 1936 was issued a decree dissolving all economic organizations other than the newly constituted state chambers of trade and of industry and commerce.

One exception was made. On grounds of being a purely cultural union, the famous Riga Gewerbeverein was not affected by the decree.

The new political organization of the state was on a corporative basis working through two supreme councils, the state economic council and the state cultural council. In theory these councils were to consist of members delegated to them by the five professional chambers of commerce and industry, of agriculture, of labour, of artisans and craftsmen and of letters and arts.

The Munich agreement of 1938 was felt by most people of Latvia to be a menace to the independence of their country. Opinion varied as to whether Russia or Germany would annex Latvia. Although not known at the time, the

late of Latvia was decided in Moscow in 1939. The secret additional protocol to the German-Soviet non-aggression pact of Aug. 23, 1939, contained in clause 1 the words: "In the event of a territorial and political transformation of the areas belonging to the Baltic states (Finland, Estonia, Latvia and Lithuania) the northern frontier of Lithuania will automatically be established as the boundary of the spheres of interest of Germany and the U.S.S.R." The document was signed by Joachim von Ribbentrop and Vyacheslav M. Molotov.

A treaty of mutual assistance with the U.S.S.R. was concluded on Oct. 5, 1939, after the Latvian foreign minister, Vilhelms Munters, had been summoned to Moscow in a manner not dissimilar from Hitlerian tactics with dependent states. The treaty provided for soviet military and naval bases in strategic points in Latvia, garrisoned by Russian troops, equivalent in strength to the Latvian standing army. The mutual assistance treaty, however, contained a solemn promise by Russia that the political and economic structure of Latvia would not be endangered. This was also promised by Stalin personally to the Latvian foreign minister.

Toward the end of 1939 Hitler ordered the German minority in Latvia to proceed to Germany and ships were sent to Riga to transport them.

Some 60,000 left and by the spring of 1940 few Germans remained in the country.

Disappearance.—The Red army invaded and occupied Latvia on June 16, 1940. With them arrived in Riga Andrei Y. Vishinsky, soviet deputy commissar for foreign affairs, whose mission was to supervise the political transformation. In July of the same year an "election" of the type which later became standard in most Russlan-occupied territories was held. Only one party, the Communist, was allowed to present candidates. Though it had been maintained that the new regime would act on the basis of the 1922 constitution, the new "parliament" in its first session passed a resolution for the incorporation of Latvia in the soviet union. Ulmanis disappeared without trace, though rumour said that he was in captivity in a small town in the Caucasus.

Toward the end of July 1940, the soviet union informed all foreign legations and consulates in Latvia that they were to terminate their activities and leave the country by Aug. 15, 1940. This was done. After that date information about Latvia could not be collected in the usual manner. It was based on reports of people who had fled from German or Russian occupation. Occasionally Russian or German official statements would throw some light on events in Latvia.

In Jan. 1941 "elections" were held for the supreme soviet of Latvia. A few Latvians were retained as figureheads, but all the key points were filled by persons sent from Russia. August Kirchensteins became chairman of the supreme soviet of Latvia. A bacteriologist, Kirchensteins was the same man whom the Russians had chosen as their quisling. He was the man who became "prime minister of Latvia" after the Russian invasion in June 1940. The "prime minister" of the soviet regime was Vilis Lacis, an author of stories of adventure. For most people in Latvia, the main feature of the regime introduced and supported by the U.S.S.R. was the rule of the Russian secret political police—the N.K.V.D.

Large numbers of Latvians of all classes were arrested and deported to Siberia, the Komi and the region of the Caspian sea, where they were held in concentration camps or employed as slave labour in the salt mines, the north Russian forests or on Siberian collective farms, as well as in road and canal building in the Leningrad area. A list of 34,250 names of Latvian deportees was placed in the files of the International Red Cross in Geneva. Executions registered during the first 12 months of Russian rule in Latvia—to June 1941—numbered 1,450.

The Germans invaded Latvia in 1941 and occupied the country until driven out by the Russians in 1943 and 1944. Under German occupation Latvia was incorporated in the economic system of Germany. The Jews were massacred by the Germans in the same bestial manner as in other parts of eastern Europe.

Fresh executions and deportations followed in the second Russian occupation of Latvia in 1944. Little news filtered through, but such as did indicated that Latvia was being absorbed into the U.S.S.R.

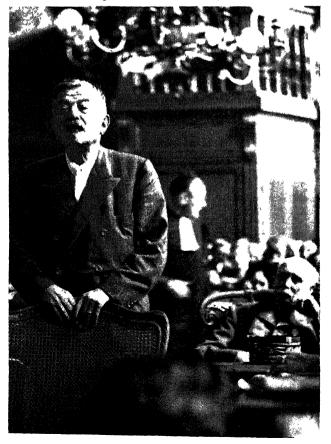

But the incorporation of Latvia in the U.S.S.R. had been officially recognized only by Germany, Finland and Sweden.

Laval, Pierre

Laval (1883-1945), French politician, was born on June 28, 1883, at Châteldon, Puy-de-Dôme. A successful lawyer, he was elected to the chamber of deputies in 1914 and to the senate in 1926. He was premier and foreign minister in 1931-32 and again premier from June 1935 to Jan. 1936. In this latter period he negotiated the muchdenounced Laval-Hoare agreement sanctioning the Italian conquest of Ethiopia. After Laval's resignation in Jan. 1936 he remained in the political background until, following France's collapse in 1940, Marshal Pétain named him his successor as well as vice-premier. Never a staunch believer in democratic rule, Laval became openly anti-Allied and pro-axis in sentiment and speech and conferred on several occasions with Hitler in 1940. A sudden rift between Pétain and Laval occurred, however, and the latter was dropped from the cabinet, Dec. 13, 1940. He was reinstated with Hitler's help on April 18, 1942, and formed a new cabinet, assuming the title of chief of government. Thereafter, Laval followed an outright pro-nazi policy. On Nov. 18, 1942, a week after Hitler had occupied all France, Pétain vested in Laval dictatorial powers to make laws and decrees on his own responsibility. Laval instigated the conscription of French labour for German factories in 1949, an action which intensified the bitter hatred for him in France. After the success of the Allied invasion of the continent was assured, he fled to Germany in Aug. 1944. He stayed in the reich until May 2, 1945, five days before Germany's surrender, when he fled to Barcelona in a German plane. He was interned in a fortress prison near Barcelona

Pierre Laval testifying as defense witness for Marshal Pétain (seated right). Convicted of intelligence with the enemy on Aug. 15, 1945, Pétain was condemned to death, but the sentence was later commuted to life imprisonment. Laval was subsequently tried on similar charges and executed Oct. 15, 1945

but was later ordered to leave the country. Laval then flew to Salzburg, Austria, where he surrendered, July 31, to U.S. army forces. He was then transported to Paris for trial. During the trial of Marshal Pétain, at which he was called upon to testify, Laval admitted that he had expressed "hope for a German victory" in a broadcast to the French people in June 1942. During his own trial which opened the following Oct. 4, Laval pleaded his case with great skill and clever showmanship, but after five days the Paris high court of justice convicted him of plotting against the state and intelligence with the enemy, and sentenced him to death. On the day he was notified that he was to be shot by a firing squad, Laval attempted suicide. He was revived by physicians, however, and led out to his execution, on Oct. 15, 1945.

Law

The decade 1937-46 was spectacular for the growth in number, size and power of U.S. administrative agencies, the vast extension of federal controls over the nation's economic life, the new approach of the majority of U.S. supreme court justices toward the solution of constitutional problems and their readiness to scuttle long-established precedents. The cumulative effect was little short of a legal revolution.

Such a revolution was necessary to provide the framework for the social and economic controls projected by President Franklin D. Roosevelt when he first took office. His promise of a new deal took shape and found expression in the legislative program adopted during his first term (1933–37). This program included relief to farmers, workers and home owners. It met strong opposition, however, from the conservative majority of justices of the U.S. supreme court who threatened the very foundations of the Roosevelt reforms with decisions knocking out the National Industrial Recovery act, the major part of the Agricultural Adjustment act of 1933, the Frazier-Lemke act of 1933, the Bituminous Coal act of 1935 and other New Deal laws.

In a determined effort to save what was left of his program, the president proposed to reorganize the supreme court under a plan calling for the voluntary retirement of justices at the age of 70 on full pay and the appointment of an additional justice for every eligible justice who failed to take advantage of his privilege to retire, the total membership of the court, however, never to exceed 15. This plan was denounced as a court-packing device and failed to get the support of congress. But the deaths and resignations of some of the conservative justices enabled the president to achieve the same objective by replacing them with liberals.

The shift in the balance of power from a conservative to a liberal majority commenced in Aug. 1937 and was completed in July 1941. In the space of four years the president had been able to appoint a total of seven justices, and the New Deal, which had shown signs of faltering, became an accomplished fact. One by one the supporting statutes were approved by the court as constitutional. A new Agricultural Adjustment act, a new Bituminous Coal act, a new Frazier-Lemke act and other laws enacted to patch up some of the holes blasted by the pre-New Deal court, were given the new supreme court's blessing. But no attempt was made to revive the NIRA.

This legal revolution had been long in the making. Increasing urban congestion, advances in science and invention, concentration of industrial and financial power and the growth of labour organizations, created new relationships, tensions and conflicts requiring regulatory and re-

medial laws. The hardships of the depression years (beginning in 1929) had stimulated public demand for social security, wage and hour controls and other reforms. This demand found sympathetic response in the law schools, whose faculties and students had for some time been preoccupied with the challenge presented to the legal profession by the increasing complexity of modern life. Law teaching in many of the schools had already shifted its emphasis from traditional common-law principles and precedents to approaches variously designated as realistic, rationalistic and functional. Controversies raged in law reviews over the nature of law, its relationship to social forces and the role of the courts. The end sought was pragmatic: to devise such legal controls as were socially necessary and desirable and to make them work.

President Roosevelt drew heavily upon young lawyers, conditioned to this approach, as technicians to improvise the legislation needed to carry out his program. The consequent creation of new administrative agencies with unprecedented powers and their incorporation into the federal system with the approval of the supreme court would have been enough to distinguish any decade as unique in legal history. This, however, was only the first phase in the development of public law. The need for mobilizing the national resources to prepare against the threat of nazi and fascist aggression brought a mass of defense and war emergency measures and a second group of agencies endowed with even greater powers of regulation; and finally, the end of World War II initiated the era of reconversion marked by the closing out of many war agencies and the enactment of a third group of public laws and administrative agencies to control the change-over to peacetime conditions. The development of public law in the several states in varying degrees followed much the same pattern. (See under sections Administrative Law, War Powers and Controls and Reconversion, of this article, below.)

There were no startling changes in the principles of private law. Trends in this field were principally toward (1) providing new remedies for old and new types of wrongs, (2) the increased use of arbitration, (3) improvements in court procedure and administration and (4) the simplification and unification of state laws.

By the passage of the Tort Claims act of 1946, congress at last made it possible to sue and recover from the federal government for the negligent or wrongful acts or omissions of its agents or employees. Compensation for such claims could formerly be obtained only through special appropriations by congress. New legal problems arising out of the growth of radio and aviation were met by legislation and court decisions. Thus the area of the law of defamation was broadened to include slander by radio, and old rules as to damage to persons and property were applied to damage by aeroplanes. A definite shift of emphasis was also discernible in negligence cases from the strict view that contributory negligence bars recovery to a newer doctrine of comparative negligence.

Arbitration achieved wide acceptance as a desirable method of settling commercial and industrial disputes without court proceedings. It was applied as a technique for adjusting labour controversies, conflicting patent claims, admiralty questions and many other conflicts. The arbitrational process as a rule proved speedier, cheaper and more satisfactory to the participants than litigation. The courts generally declined to review the findings of arbitrators chosen by the parties under a valid agreement. Many states enacted statutes for the regulation of arbitration,

and under the national Contract Settlement act of 1944 it was made available to contractors as an alternative to court proceedings in adjusting claims against the federal government.

Procedure in the federal courts was completely revamped through the adoption of uniform rules both for civil and criminal actions to apply throughout the United States. Previously there had been uniformity only in equity and admiralty practice. Federal procedure in common-law actions had been as varied as that of the 48 states, since it was required to conform to the rules of the state courts in each district.

Federal criminal procedure also varied widely in the different districts. In 1938, however, the supreme court, pursuant to authority granted by congress, adopted new rules governing civil procedure in all district courts. These rules abolished distinctions between law and equity actions, substituted a single motion for demurrers and various pleas, granted flexible powers of discovery, permitted wide latitude in the joinder of parties and causes of action and provided pretrial procedure for the elimination of uncontested issues and facilitation of settlements. The supreme court also adopted new rules of criminal procedure (see Criminal Law, below). Further progress was achieved through the creation by congress of the administrative office of the U.S. courts charged with attending to the business needs of the federal judicial system and making recommendations for its more speedy and efficient opera-

The movement for simplification and unification of state laws also gained ground. The national conference of Commissioners on Uniform State Laws completed, 25, or more uniform and model state laws, which were promulgated with varying degrees of success. In 1944 the American Law institute completed its 19-volume restatement of the law, begun in 1923, intended to express existing common law with such clarity and precision that it would be accepted by courts throughout the nation as correct. The restatement covered agency, contracts, property, torts, trusts and other basic subjects of the common law. With the completion of this work, the institute turned to a new project: the production of a uniform commercial code, in co-operation with the Commissioners on Uniform State Laws. Some lawyers considered it significant that an organization which had devoted 21 years to a restatement of case-law principles should join in what was essentially a movement for codification. The gradual conversion of U.S. common law into a semblance of the civil or code law system (as exemplified in France) seemed to them probable.

The decline in the importance of judge-made law was further indicated by the tendency of the supreme court of the United States to overrule prior decisions and depart from established principles. Parallel with this retreat from the doctrine of *stare decisis* (to stand by decisions) ran the tendency of the supreme court to broaden the powers of administrative agencies and to refuse to review their findings unless convinced that they were based on errors of law rather than fact.

These trends apparently stemmed from the inclination of a majority of the justices to apply social rather than technical legal criteria in determining the extent of legislative, executive and administrative powers and in resolving conflicts between government departments, state and federal, and between government and private interests. This approach was particularly noticeable in the construction of statutes. The more liberal justices interpreted

legislative acts in the light of the social ends they believed the legislators intended. But critics of this point of view asserted that the court read into some statutes meanings which the framers never entertained and which could not be reasonably deduced from the statutory context.

With the war's end, public interest focused sharply on international legal developments. The mass trial of nazi leaders before a four-nation tribunal at Nuernburg established a new type of court and a new application of existing principles of law. For the first time in history high military and political officials of a defeated nation were convicted by an international court of crimes against world peace and against humanity.

Through congressional action, the United States became a member of the International Monetary fund and International Bank for Reconstruction and Development, contributed heavily to the United Nations Relief and Rehabilitation administration, extended the Reciprocal Trade Agreements act, joined the United Nations, its Educational, Scientific and Cultural organization (U.N.E.S.C.O.), and its Food and Agriculture organization (F.A.O.). Proposals for international control of atomic energy were debated but not acted upon. In the United States, however, the development and control of atomic energy were assigned to a five-man civilian commission under the Atomic Energy act of 1946 against the protests of proponents of military control, but a liaison committee was created to co-operate with the army and navy departments. The new law reserved to the federal government exclusive control over the production, ownership and use of fissionable material and provided the death penalty for disclosure of secrets in that field.

The decade closed upon a legal scene little less complex than during the height of war activity. The first functioning of reconversion laws brought the termination of many war agencies and a general shifting and realignment of the functions of those which remained. Administrative agencies and the courts were confronted with new problems of job reinstatement for veterans, surplus property disposal, housing and tax readjustment, but the dominant and most difficult issue arose in the field of labour-management relations. The rapid decontrol of prices and rationing set off the long-expected upward spiral of prices and wage demands, resulting in strike tie-ups of essential industries affecting the entire national economy and evoking demands for statutory machinery for the compulsory arbitration of labour disputes.

The production of legal literature during the decade in the form of statutes, executive orders, agency regulations and rulings, local ordinances, court reports, digests, cyclopaedias, textbooks and commentaries, ran to an incalculable total of many thousands of volumes and millions of words.

Administrative Law.—Administrative law expanded to an astounding bulk and complexity. Numerous new agencies, created during the first phase of the New Deal, had become an integral part of the governmental machine before President Roosevelt's second inauguration. By the end of 1937 the supreme court had approved the legislation establishing such major agencies as the Social Security board and the National Labor Relations board. After a short interval, during which the depression-born agencies were achieving a precocious maturity, a new group of bureaus was set up by statute and executive order to regulate and direct the national economy toward preparation for defense against war and finally for the prosecution of war itself. Under the hands of the president agencies sprouted, grew, branched, flowered and died with the speed of the

stage magician's orange tree. Other bureaus pushed up to replace them. Branches were lopped off and grafted on the trunks of almost unrelated departments. The history of the making, unmaking and shifting of agencies during the decade would require a sizable volume.

These new instruments of government, whether for permanent or emergency purposes, were built to a similar pattern. Congress gave them rather broad powers, often including prosecutory and judicial functions to be exercised under rules and regulations devised by the agencies themselves. Their controls were reinforced by publicity, the granting and withholding of benefits and enforcement machinery operating through criminal prosecutions and civil damage suits. Rather drastic limitations were placed by some statutes on the right to a court review of administrative decisions.

These developments were disquieting to lawyers and business men reared on the constitutional doctrine of the separation of governmental powers and traditional concepts of "due process." Equally disquieting was the unprecedented production of administrative orders, rules, regulations and decisions. By comparison with this jungle, the common law's "wilderness of single instances" looked like a well-kept grove.

The American Bar association took the lead in trying to bring the exuberant growth of administrative law under statutory control. It advocated the revision and unification of federal administrative procedures in the direction of divorcing the prosecutory from the judicial functions and increasing the latitude of judicial review of agency rulings. President Roosevelt also seemed to recognize the dangers of an uncontrolled expansion of administrative powers even though he had been chiefly instrumental in stimulating the process. In 1937 he transmitted to congress the report of a special committee which advocated the division of federal agencies into administrative and judicial sections. In commenting on the report, the president warned against the development of a "fourth branch" of the government not authorized by the constitution.

The demand for reform resulted in the passage of administrative procedure acts in North Dakota, Wisconsin, North Carolina, Ohio and California. But similar measures presented to congress were sidetracked because of the urgency of defense and war activities. The authority and powers of federal agencies, instead of being checked, were substantially increased. The flood of peacetime rules and regulations became a cloudburst of orders relating to priorities, prices, rents, production, rationing, manpower, selective service and governmental contracts. With the end of the war, however, the fight for over-all regulation of federal agencies was revived. It resulted in the enactment of the much-debated McCarran-Sumners bill, which in its final form became the Administrative Procedure act of 1946. The new law (1) provided that agencies should issue as rules certain specified information concerning their organization and procedure, (2) laid down the essentials of several forms of administrative proceedings and the limitations on administrative powers, (3) provided in more detail the requirements for administrative hearings and decisions where such hearings were required by statute, (4) assured a remedy by judicial review for every legal wrong due to agency action except so far as statutes precluded such review or the action was within the scope of agency's legal discretion and (5) set up a system of semi-independent trial examiners recruited under civil service to preside over hearings. The act also extended to all agencies the requirement of internal separation of functions between investigating and prosecuting officers and hearing or deciding officers.

The Administrative Procedure act made no attempt, however, to codify administrative law or change its basic principles. Those principles had been fairly well worked out by the courts prior to 1937. During the decade that followed there was a strong trend toward sustaining the powers delegated to agencies by legislative bodies and giving finality to agency findings. The supreme court in general approved the rule-making and fact-finding powers of federal agencies whenever it appeared that congress had prescribed adequate standards for determining the occasions for the exercise of such authority. Thus the court found that the standards laid down under the price control and wage-hour acts were sufficiently precise to justify most of the activities of the administrators appointed to enforce those laws, including the right of government agents to enter business places and seize ration books, permits and other government-issued papers without a search

But the powers exercised by agencies were limited to those actually delegated by statute. Agency hearings were required to conform both to the letter and spirit of the statutory authority granted. The supreme court ruled that the price administrator did not have an absolute right to the issuance of injunctions restraining future violations of price ceilings; that the price administrator's status in public utility rate hearings was restricted to showing the probable inflationary effect of proposed rate increases; that the wage and hour administrator had no right to issue regulations determining the extent of his own authority; that the social security board exceeded its authority in refusing to classify back pay as wages; and that the postmaster general exceeded his powers in withholding second-class privileges from a magazine because he disapproved of its contents on moral grounds.

Participants in agency hearings found that it was more important to obtain favourable results before the agency than to rely on judicial review. Such review could not be had until all administrative remedies had been exhausted; and even when an appeal was properly brought, the courts were disinclined to interfere with administrative findings unless there had been lack of authority in the agency or a decision was based on arbitrary action. The supreme court refused to disturb orders of the Federal Power commission, the Federal Security administrator, the National Labor Relations board and the Interstate Commerce commission based on findings of fact arrived at after consideration of carefully accumulated evidence, much of it highly technical in character. The court took the view that administrative tribunals had special experience and expertness in their respective fields which should not be supplanted by the less specialized knowledge of a reviewing court.

The court at the same time somewhat enlarged the scope of judicial review, holding that it could include consideration of "negative" as well as "affirmative" orders of commissions. But orders could not be sustained merely on "broad equitable principles." Nor would the court give finality to administrative decisions where it appeared that there had not been a fair hearing.

The Reorganization act of 1945 directed the president to examine the organization of all agencies and to submit plans to congress for greater efficiency in the operation of government through the transfer, co-ordination, consolidation and abolition of agencies. Pursuant to this act the president in 1946 submitted recommendations to congress

Congress also planned its own remodelling through the Reorganization act of 1946, which provided for the merger of 33 senate committees into 15 and 48 house committees into 19. A new joint committee of both houses on national defense would replace their respective committees on military and naval affairs. The taxing and appropriation committees of heavest rore also required to meet jointly

for the realignment of various agencies and their functions.

tary and naval affairs. The taxing and appropriation committees of both houses were also required to meet jointly at the opening of each session of congress for the purpose of balancing expenditures against revenues. Salaries of senators and representatives were raised from \$10,000 to \$12,500 a year, and they were allowed \$2,500 for annual

expenses.

Agriculture.—The federal program of aid to farmers, begun in 1933 with a series of laws granting subsidies through parity payments, establishing control of prices and quotas for production, promoting rural electrification, extending credit and providing other relief, was reinforced and elaborated by new legislation. This included the Agricultural Marketing Agreement act (1937) for the arbitration of disputes concerning the marketing of milk and milk products, the Sugar act (1937) for the control of the production of sugar, the new Agricultural Adjustment act of 1938, for the adjustment of freight rates on farm products, fixing marketing quotas, making loans and parity payments, the Crop Insurance act (1938) to alleviate distress caused by crop failures, the Seed act (1939) regulating interstate commerce in seeds, the Agricultural Research act (1946) and other enactments extending the life of certain agencies, providing appropriations for their support and amending and extending various regulatory devices.

The U.S. supreme court in general sustained federal legislation giving government agencies control over agricultural production and prices and disapproved state laws in the same field insofar as they interfered with the exercise of the commerce powers of congress. Certain aspects of state laws aimed at the control of marketing, such as the Michigan Milk Marketing act, Utah Milk Control act and Florida's Grower's Cost Guarantee law, were knocked out by state reviewing courts. (See Agriculture.)

Aliens and Citizenship.—Congress struck at foreign propagandists with the passage of the Foreign Agents Registration act of 1938 (amended in 1942), requiring all agents of foreign governments and foreign principals to register with the attorney general, to label all political propaganda sent through the mails, to file copies thereof in the Library of Congress and to keep records open to inspection. The 1941 conviction of the pro-nazi propagandist, George Sylvester Viereck, for violating this act, was reversed by the supreme court, but the court declined to review his second conviction.

Further precautions against espionage and sabotage were taken through the passage of the Alien Registration act of 1940, which ordered the registration and fingerprinting of all aliens. The Nationality act of 1940 codified all laws relating to citizenship, naturalization and expatriation and amended prior provisions concerning national defense and subversive activities. Later enactments tightened the controls on immigration, strengthened the deportation laws, extended special naturalization privileges to aliens who served in the U.S. army, navy, marine corps or coast guard, and provided for the loss of citizenship by naturalized citizens through extended residence in a foreign country or other acts indicating expatriation.

Early in 1942 the attorney general began a campaign to cancel the citizenship of disloyal naturalized citizens, which

resulted in more than 40 denaturalizations before the year's end. The supreme court, however, applied brakes to this procedure in two important decisions. The court set aside the cancellation of a naturalization certificate granted in 1927 to an admitted Communist on the ground that the government had not proved with requisite certainty that the attitude of the Communist party at the time when the petitioner was naturalized created a "clear and present danger of public disorder." The facts and the law should be construed as far as reasonably possible in favour of citizenship (Schneiderman v. U.S., 320 U.S. 118 [1943]). The court applied the same test to an alleged nazi follower, holding that a naturalized citizen was entitled to the same degree of freedom of speech as one native-born (Baumgartner v. U.S., 322 U.S. 665 [1944]). But in 1946 a majority of the justices approved the denaturalization of a defendant who had obtained citizenship on the basis of a false oath of allegiance to the United States when in fact he was a thoroughgoing nazi and Hitlerite (Knauer v. U.S., 66 S. Ct. 1304 [1946]). On the other hand, the court held that an applicant for citizenship need not pledge himself to bear arms in defense of the United States, if he was otherwise qualified (Girouard v. U.S., 66 S. Ct. 826 [1946]). The court thereby overruled its 15 year-old decisions in the Schwimmer, Macintosh and Bland cases.

The supreme court also extended the rights of freedom of speech and of the press to aliens in a 5 to 3 decision quashing the order of Attorney General Francis Biddle for the deportation of Harry Bridges, west coast Congress of Industrial Organizations leader. Utterances and activities amounting to mere co-operation with the Communist party did not constitute such "affiliation with" a subversive organization as to render an alien deportable (Bridges v. Wixon, 326 U.S. 135 [1945]).

A series of executive orders (1941-42) subjected enemy aliens to surveillance, forbade them to travel without permission and ordered them to turn over to the U.S. marshal all radio transmitters, short-wave sets, cameras and firearms. Certain areas were designated as closed to enemy aliens. A curfew order issued by the western defense command requiring persons of Japanese ancestry to remain at home between 8 P.M. and 6 A.M. was held by the supreme court to be properly applied to U.S. citizens of Japanese descent (Hirabayashi v. U.S., 320 U.S. 81 [1943]). The court also upheld the removal of persons of Japanese ancestry (even though American-born citizens) from west coast areas and their relocation in internment camps as reasonably necessary to prevent espionage and sabotage in view of the danger of invasion at the time of the order (Korematsu v. U.S., 323 U.S. 214 [1944]). But in a second case the court ordered the release of a Japanese-American woman from a relocation centre because of her admitted loyalty. The power of detention was justified only as a protection against espionage and sabotage (Ex parte Endo, 323 U.S. 283 [1944]).

On Feb. 8, 1944, the president by proclamation fixed the annual immigration quota for Chinese at 105 to comply with an act of congress (Dec. 17, 1943) which repealed the Chinese exclusion laws and extended the privilege of naturalization to persons of Chinese descent. Persons of races indigenous to India and the Philippines were made eligible for admission to the United States and for naturalization by act of congress in 1946. (See also ALIENS.)

Bankruptcy.—The first thorough revision of federal insolvency laws in 40 years was achieved through the Chandler act of 1938. It was designed to streamline bankruptcy law by giving referees greater powers, speeding up and simplifying procedure, clarifying the powers and jurisdic-

tion of federal and state courts, broadening the benefits of reorganization and debtor-relief provisions and increasing the opportunity for creditor control and supervision. The new bankruptcy code included the provisions of the Frazier-Lemke act and the Municipal Bankruptcy act. The first versions of these two laws had been found unconstitutional by the supreme court. But the Frazier-Lemke act, as revised and re-enacted in 1935, was ruled valid in 1937 (Wright v. Vinton Branch, 300 U.S. 440). Relief was thereby given to farmer debtors through composition, extension and redemption procedures. The Municipal Bankruptcy act, patched up by congress in 1937 to meet high court objections, provided for the readjustment of the debts of local taxing bodies. It was held valid in 1938 (U.S. v. Bekins, 304 U.S. 27).

Many phases of the complex bankruptcy structure, too technical to report here, were construed by the federal courts.

Business Regulation.—Governmental regulation of business developed enormously: first, under the continued impetus of the New Deal program, and secondly, under the mobilization of the nation's resources and energies for defense and war purposes. The latter phase is reported later in this article under War Powers and Controls.

Peacetime regulation was directed toward achieving a reasonable balance among conflicting forces in a competitive economy by providing controls against monopoly and unfair practices while leaving business as free as was compatible with public interest. This effort involved problems of encouraging invention by granting monopoly rights under the patent laws and at the same time curbing the abuse of such rights; of safeguarding investors without too greatly restricting business enterprise; of limiting competition in the public utility, transportation and communication fields for the sake of economy and efficiency while keeping a check on the concentration of power through control of franchises and rate-making; of protecting business against ruinous price cutting without sanctioning price fixing; of encouraging farm production through subsidies and price guaranties without placing unfair burdens on consumers and taxpayers; and of permitting reasonable latitude in promoting the sale of merchandise while forbidding deceptive advertising and misbranding.

Antitrust.—The greatest trust-busting campaign since the passage of the Sherman act was opened in 1937 with a blast from Attorney General Robert H. Jackson against the supreme court's leniency in antitrust cases. This was followed by recommendations from President Roosevelt in his 1938 message to congress for strengthening antitrust procedures and revising the patent laws. Government forces realized that they faced a difficult task in trying to break up combinations entrenched behind intricate patent licensing agreements. The situation was further complicated by the Miller-Tydings act of 1937 which legalized vertical resale price maintenance agreements affecting interstate commerce, when they did not violate the laws of the state of resale.

The antitrust drive was assigned to the direction of Assistant Attorney General Thurman Arnold, who proceeded to enforce the laws against monopolies with marked success. The president sought to strengthen the government's hand through the appointment of the Temporary National Economic committee, which investigated the monopoly problem in 1939 and 1940 and reported its findings in 43 monographs, recommending the vigorous enforcement of antitrust laws, drastic changes in the patent structure, repeal of the Miller-Tydings act and other action. But most of the TNEC proposals were sidetracked

because of the growing need by the government for the full co-operation of industry in defense and war production. The attorney general agreed not to press any antitrust suits which the secretaries of war and navy believed would impede the war effort. At the same time congress preserved the government's right to reopen such cases by suspending operation of the statute of limitations until June 30, 1945. This arrangement narrowed the battle front but did not end the fight against monopoly. The antitrust division proceeded rapidly to cut away all entanglements between domestic industries and nazi-controlled cartels, especially in such industries as chemicals, dyes and medical supplies. This was accomplished mostly through consent decrees by which defendants avoided prosecution by agreeing to the entry of court orders forbidding the continuance of objectionable practices.

The campaign continued also against domestic monopolies not engaged in war production. The government followed the Louis Brandeis formula in its preparation of cases, gathering and presenting an overwhelming mass of facts to support a particular prosecution. Thus the suit for dissolution of the aluminum trust required a three-year hearing resulting in 40,000 pages of testimony. The government thereby proved a monopoly by the defendants through their control of 90% of the aluminum ingot market, and the circuit court directed that a decree be entered restraining "price-squeeze" practices, but it declined to dissolve Alcoa (Aluminum Company of America) because of a possible adverse effect on war production.

The court sustained a decree against a group of companies operating motion picture theatres in 70 southern towns for violating the Sherman act by combining their film buying power to drive independent exhibitors out of business (U.S. v. Crescent Co., 323 U.S. 173 [1944]); affirmed a judgment of \$360,000 against 9 film companies for violating the Sherman act through use of the block booking system of distributing films (Bigelow v. RKO, 66 S. Ct. 574 [1946]); and approved fines totalling \$250,000 against 3 big tobacco companies for violating the Sherman act through a price monopoly on leaf tobacco and tobacco products. In the latter case the court held that there was a violation even though competition was not completely barred (Am. Tobacco Co. v. U.S., 66 S. Ct. 1125).

In three cases the application of the antitrust laws was extended into new fields. In a 4 to 3 decision of great impact, the supreme court upheld a Georgia indictment of 198 stock fire insurance companies and 27 individuals for conspiring to violate the Sherman Anti-trust act by fixing premium rates and agents' commissions and forcing nonmember companies and independent agencies into line through boycotts and intimidation. In earlier cases, which did not involve the Sherman act, the court had expressed the view that "issuance of a policy of insurance is not a transaction of commerce." Now, however, the court ruled that the insurance business was in fact one of the largest and most important branches of interstate commerce (U.S. v. South-Eastern Underwriters, 322 U.S. 533). As a sequel congress passed a moratorium act providing that until Jan. 1, 1948, the Sherman and Clayton acts would not be applicable to the insurance business.

The court also held that boycott practices by two medical societies which obstructed the business of a nonprofit corporation devoted to providing medical care and hospitalization to government employees were violations of the Sherman act (American Medical Association v. U.S., 317 U.S. 519 [1943]).

A third important extension of the Sherman act was the court's 5 to 3 ruling that the collection and distribution of news was interstate commerce subject to federal control. The Associated Press, a co-operative association of more than 1,200 newspaper publishers, was directed to revise certain by-laws which had operated in restraint of trade. The freedom of the press guaranteed by the first amendment, said the court, did not include "freedom to continue to keep others from publishing." (A.P. v. U.S., 65 S. Ct. 1416).

The antitrust division launched a special drive against restraints of trade based on the misuse of patent rights. Following leads provided by the TNEC, the government in Dec. 1939 filed suit to break up monopolies in the glass container industry. Within a period of a little more than 5 years, a total of 56 actions was brought to outlaw devices through which patents had been used to restrict competition. This was more than twice as many cases as the government had started during the preceding 27 years.

The trial of the glass container case lasted 112 days and resulted in a decree of 46 printed pages in which the lower court made 628 findings of fact and 89 conclusions of law based on a printed record of 16,500 pages. The defendants, including all the major companies in the industry, their officers and a trade association, were found to control more than 840 patents for glassmaking machinery. Provisions of the decree directing them to license all applicants to manufacture and use the patented machinery at uniform reasonable royalty rates were approved by the supreme court, but more drastic provisions, which would in effect have divested them of all benefits from their patents, were set aside (Hartford-Empire Co. v. U.S., 65 S. Ct. 815).

The department of justice uncovered an extraordinary variety of devices by which patents were used to divide markets into noncompetitive areas, establish price-fixing schemes, limit production and quality, control supplies and parts relating to patented articles, enforce tie-in agreements and restrict competition through patent pooling, cross-licensing and blocking off and fencing in competitors. Some of these practices were terminated in some industries through consent decrees, but a large number of cases were fought through to the U.S. supreme court. The resulting decisions drastically limited the power of patentees to control the prices of patented articles through licensing agreements.

Fair Trade Laws.—The antitrust laws were amended in 1936 by the Robinson-Patman act and in 1937 by the Miller-Tydings act. Both laws were directed against unfair trade practices.

The Robinson-Patman act prohibited price discrimination through the improper use of discounts, commissions, rebates and advertising allowances. Its administration was assigned to the federal trade commission which applied the law by outlawing various discriminatory devices known as "basing-point systems," "delivered-price marketing" and "zone pricing." Federal Trade Commission rulings in this respect were generally upheld by the courts.

The Miller-Tydings act legalized vertical price maintenance agreements affecting interstate commerce whenever such agreements were valid under the laws of the state of resale. Vertical agreements are those made in the direct line from production to distribution between manufacturer and wholesaler or between the latter and the retailer. Horizontal agreements are those made by groups of manufacturers or wholesalers or retailers on the same trade level. Vertical agreements were legalized in almost every state

through "fair trade" laws prohibiting predatory price cutting on trade-marked commodities in open competition by permitting the manufacturer to determine the minimum resale price. The U.S. supreme court in 1936 held such state acts constitutional, and conflicts between such laws and the Sherman act were eliminated by the Miller-Tydings act. Horizontal price fixing, however, remained illegal.

The powers of the FTC were expanded in 1938 by the Food, Drug and Cosmetics act and the Wheeler-Lea amendment to the Federal Trade Commission act. The new food and drug law struck at misbranding and adulteration with broader and more drastic provisions than the Food and Drug act of 1906. The Wheeler-Lea act extended the commission's jurisdiction from the suppression of unfair competitive practices to the prohibition of practices that deceive the public. In order to curb false and misleading advertising the FTC no longer had to show that such advertising injured a competitor. It was sufficient to show that consumers would be injured.

Public Utilities and Carriers.—Noteworthy developments were: (1) extension of the area of federal control, (2) establishment of new theories and systems of cost accounting in connection with rate regulation, (3) the creation of "yardsticks" as a measure of the cost of producing electricity and (4) the attack upon holding company abuses.

The Natural Gas act of 1938 enlarged the authority of the Federal Power commission to include the regulation of the sale of natural gas moving in interstate commerce. Thus federal control over power resources became practically complete. Jurisdiction over water power and electricity had been previously assigned to the FPC, and regulation of the nation's principal fuel supplies had been asserted by the national government under the Hot Oil act of 1935 and the Bituminous Coal act of 1937. The latter act was a revised version of a 1935 statute which had been nullified by the supreme court. The 1937 coal act was approved by the court in 1940.

Public utility commission orders requiring companies to rewrite their books to conform to newer theories of ratemaking were generally approved by the courts. The trend was to use the "original cost" of the utility companies' properties instead of the "present value" as a basis for computing a fair return on their investments.

Especially significant was the development of government supported power projects to furnish "yardsticks" for the cost of producing electricity. Private utility companies fought a losing battle to enjoin construction of the Norris and other dams by the Tennessee Valley authority (TVA). The courts ruled that the production and sale of electrical power by TVA was a constitutional exercise of federal defense and commerce powers. Rural electrification, authorized under a 1936 statute, resulted in the construction of many small power plants, financed through federal loans. Such enterprises served as competitive checks on privately-owned utilities in certain areas.

Another form of regulation was instituted under the Public Utilities Holding Company act of 1935. In addition to provisions requiring public utility companies to register with the Securities and Exchange commission, the act contained the much-discussed "death sentence" clause, which limited holding company structures to a single integrated utility system. The first important case under this clause to reach the U.S. supreme court involved the North American company system which controlled 80 subsidiaries and operated in 17 states and the District of Columbia. The death sentence against North American decreed by the SEC was approved by the high court.

Jurisdiction of the Interstate Commerce commission was

both extended and curtailed. Originally endowed with strong regulatory powers over railroads, the ICC acquired control over interstate motor carriers in 1935 and over water carriers under the Transportation act of 1940. The commission was deprived of control over air carriers, however, by the Civil Aeronautics act of 1938. This law created a Civil Aeronautics authority with power to regulate all phases of interstate and foreign aviation. The CAA was authorized to control the formation of new air transport companies, issue certificates of convenience and necessity, regulate rates and enforce safety rules.

Regulation of interstate and foreign commerce in communication by wire and radio remained in the hands of the Federal Communications commission. The use of threats to compel radio stations to hire persons for broadcasting in excess of those needed and other coercive practices was outlawed by the Lea or "Anti-Petrillo" act of 1946. (See also Public Utilities.)

Securities Regulation .- Congress re-enforced federal controls over the issuance and sale of securities through the passage of the Trust Indenture act of 1939 and Investment Advisers acts of 1940. Conversion of the old rule of caveat emptor to caveat venditor had already been achieved under the Securities act of 1933 and the Securities Exchange act of 1934. These federal controls climaxed the movement to protect investors which had previously resulted in the enactment of state blue sky laws throughout the nation. The Securities act required registration of all issues and full disclosure of facts enabling buyers to judge investment values. The Securities Exchange act created the Securities and Exchange commission (q.v.) with power to regulate trading in securities on national exchanges. It also outlawed excessive margin trading, pool operations and other abuses against the public interest.

The Trust Indenture act of 1939 further protected investors by laying down minimum standards of responsibility for trustees under instruments securing bonds and similar obligations. Investment trusts were brought under the jurisdiction of the SEC by the Investment Company act, and investment counsellors were required to register with the SEC under the Investment Advisers act.

Thus almost every aspect of the issuance and trading in securities in interstate commerce was brought within the jurisdiction of the SEC by 1941. Signs pointed, however, to a possible reversal of the trend through proposals to restrict the jurisdiction of the commission.

The courts tended toward a liberal construction of laws relating to securities control. The term "security" was extended by the supreme court to include "novel, uncommon or irregular devices . . . if it be proved as a matter of fact that they were widely offered or dealt in under terms or courses of dealing which established their character in commerce as 'investment contracts,' or any interest or instrument commonly known as 'security.'" The court held that assignments of oil and gas leases under arrangements by which a promoter would drill a well on a neighbouring tract and thereby enhance the value of the investment sold to the public were subject to federal control (SEC v. Joiner Corp. 64 S. Ct. 124 [1943]). The court also held that an offering by a company of units in a citrus grove development coupled with a service contract by an affiliated company constituted an "investment contract" subject to SEC regulation even though the enterprise was not speculative (SEC v. Howey Co., 66 S. Ct. 1100 [1946]). (See also Business Review; New Deal; STOCKS AND BONDS.)

Civil Rights.—At the insistence of members of the sect known as Jehovah's Witnesses, the U.S. supreme court

wrote a new chapter in the law of religious freedom. The Witnesses won almost complete exemption for themselves and other proselytizers from laws restricting the right to distribute religious literature. In 1939 the court established the freedom of political and labour, as well as religious, propagandists to pass out handbills on public streets in spite of antilitter ordinances. Municipalities, the court said, could not use their police power to abridge the freedoms of speech and press in violation of the 14th amendment (Schneider v. State, 308 U.S. 147). The court had previously ruled that a statute giving a public official discretion to grant or refuse a licence for the sale of literature violated, constitutional guarantees (Lovell v. Griffin, 303 U.S. 444). But in 1942 the court, by a 5 to 4 vote, held that a city ordinance requiring a licence fee from all persons selling printed matter on the street or from house to house was properly applied to distributors of religious tracts (Jones v. Opelika, 316 U.S. 584). The court distinguished the situation from prior cases on the ground that the ordinance in question left nothing to official discretion.

Jehovah's Witnesses, however, refused to abide by this decision. They defiantly continued to disseminate views distasteful to many people through methods often annoying. Their persistence won a complete about-face from the supreme court. In 1943, again by a 5 to 4 margin, the court (overruling the *Opelika* decision) held that an ordinance requiring religious colporteurs to obtain a licence and pay a fee was invalid. Cities might prohibit the use of their streets for purely commercial enterprises, but the fact that religious literature was sold rather than given away did not make the enterprise commercial. To charge a licence fee for such evangelism violated the 1st and 14th amendments (*Murdock* v. *Pennsylvania*, 319 U.S. 105).

The way was thus opened to the Witnesses for further victories. In 1943 the supreme court, at their instance, knocked out several other restrictive ordinances. In Martin v. Struthers, 319 U.S. 141, they won the right to ring doorbells and otherwise disturb householders and their families for the purpose of seeking converts and distributing religious dodgers in spite of an ordinance forbidding the practice. Four justices dissented. The right to proselytize was further extended in 1946 by two 5 to 3 decisions. The manager of a company-owned town in Alabama had no right to stop religious zealots from handing out tracts on the streets (Marsh v. Alabama, 66 S. Ct. 276). Similarly, the court held that the manager of a Texas village which was owned by the United States abridged freedom of religion and the press in driving out Witnesses who campaigned for converts from door to door (Tucker v. Texas, 66 S. Ct. 274). State laws, making it a crime to refuse to leave premises when ordered out, did not justify the expulsion of missioners.

The Witnesses suffered a serious setback, however, when they came in conflict with the Massachusetts Child Labor law. A member of the sect, who took her nine-year-old niece with her on the streets at night to display and sell copies of Watch Tower and Consolation, was convicted of violating the state labour laws. In affirming the state court's decision, the U.S. high court ruled that the interests of society in protecting children outweighed the concept of religious liberty (Prince v. Massachusetts, 321 U.S. 158 [1944]).

The supreme court's reversal of the Opelika decision was paralleled by a similar change of position in the flag-salute cases. In 1940, also at the instance of the Witnesses, the court sustained a Pennsylvania regulation requiring

pupils in public schools, on pain of expulsion, to take part in a daily ceremony of saluting the U.S. flag while reciting the pledge of allegiance (Minersville School District v. Gobitis, 310 U.S. 586). But in 1943 a similar law prescribing "the commonly accepted salute to the flag" as a regular part of the program of public schools, was held to violate the 1st and 14th amendments (West Virginia Board of Education v. Barnette, 319 U.S. 624).

Freedom of conscience was recognized under the Selective Service act as a basis for exemption from combat service. "Regular or duly ordained ministers of religion" were exempted from training and service but not from registration. Conscientious objectors who were not ministers were inducted, however, and assigned "to work of national importance." Considerable controversy arose as to the administration of the draft laws in this respect. The contention of Jehovah's Witnesses that they were all entitled to complete exemption as ministers was generally denied by draft boards, which usually listed them as conscientious objectors. Some of the Witnesses refused to report for service when ordered to do so, and when prosecuted, set up the defense that it was not a crime to disobey an order based on a wrong classification. The supreme court in 1944 ruled that this was not a good defense (Falbo v. U.S., 320 U.S. 549). But in 1946 it modified its position, holding that a registrant might properly raise such a defense after reporting for induction and acceptance by the armed forces. The Falbo ruling did not apply because in that case the administrative process had not been completed by acceptance of the registrant (Estep v. U.S.; Smith v. U.S., 327 U.S. 114).

Refusal of the Illinois supreme court to license a conscientious objector to practise law was sustained by the U.S. supreme court in a 5 to 4 decision. The applicant was otherwise qualified but would not take the required oath that he would support, the state constitution because it would have pledged him to perform military service (In re Summers, 325 U.S. 561 [1945]). A year later, however, the supreme court held that refusal to promise to bear arms was not a valid ground for denying U.S. citizenship to an otherwise qualified alien (Girouard v. U.S., 66 S. Ct. 826).

Civil rights were not seriously impaired by prosecutions under the espionage and sedition laws. The department of justice exercised marked restraint in contrast with its attitude during World War I. The supreme court upheld provisions of the Espionage act of 1917 which made it a crime to transmit "information respecting the national defense . . . to be used to the injury of the United States or to the advantage of any foreign nation," friend or foe. The prewar conviction of two defendants in California for violating the act by furnishing the U.S.S.R. with U.S. naval intelligence reports was affirmed despite their contention that they believed the information to be "innocuous" (Gorin v. U.S., 312 U.S. 19 [1941]). The court declined to review the conviction of 18 Trotskyites for advocating the overthrow of government by force and inciting disaffection in the armed forces in violation of peacetime provisions of the Alien Registration act of 1940; but the court reversed the conviction of 24 members of the German-American bund under the Selective Service act for advising followers to refuse military duty until a provision of the act prejudicial to bund members seeking employment should be held constitutional (Keegan v. U.S., 325 U.S. 478 [1945]).

With the outbreak of World War II an office of censor-

ship was established by executive order with absolute discretion to censor international communications. No domestic censorship was exercised, however, except through the voluntary co-operation of publishers and the barring from the mails of Father Charles E. Coughlin's Social Iustice and publications deemed hostile to the war effort.

The attempt of the postmaster general to wield a power of moral censorship over periodicals through the denial of second-class mailing privileges to Esquire magazine was rebuked by the supreme court. It rejected the postmaster's view that he could use such privileges as a special award to give competitive advantages to "good" magazines over those he considered "bad." The Massachusetts supreme court affirmed the conviction of a bookseller under the state's obscenity statute for selling a copy of Strange Fruit. It ruled that sex scenes in Lillian Smith's best-selling novel of miscegenation went beyond the bounds of decency. Nevertheless, the court approved the doctrine expounded by Judge John Woolsey in the Ulysses case that the effect of the entire book, not of isolated passages, upon its "probable audience" should be considered.

In a series of cases the supreme court struck at discrimination against Negroes. The court held that denial of a scholarship in a state university law school solely on the ground that the petitioner was a Negro was unconstitutional (Missouri ex rel. Gaines v. Canada, 305 U.S. 337 [1939]); set aside statutory restrictions in Oklahoma on the right of Negroes to vote (Lane v. Wilson, 307 U.S. 268 [1939]), and the Texas "white primaries" law, overruling a 1935 decision (Smith v. Allwright, 321 U.S. 649 [1944]); held that "peonage" statutes in Georgia and Florida violated the ban of the 13th amendment against involuntary servitude; affirmed the power of the federal government under a 75-year-old law to punish state officers for violating the civil rights of Negroes (Screws v. U.S., 325 U.S. 91 [1945]); reversed one Texas conviction of a Negro based on an indictment by a grand jury from which Negroes were excluded but affirmed a similar conviction where one Negro had been included on the panel; granted relief in two cases to Negro locomotive firemen against discrimination by a labour union; upheld provisions of New York's Civil Rights act which made it a penal offense for labour organizations to deny membership to any person by reason of race, colour or creed (Railway Mail Association v. Corsi, 326 U.S. 88 [1945]); and knocked out Jim Crow segregation of bus passengers in interstate traffic (Morgan v. Virginia, 66 S. Ct. 1050 [1946]).

The New York Fair Employment Practices act became effective July 1, 1945. It declared the opportunity to obtain employment without discrimination to be a civil right and outlawed discrimination by employers and labour unions against any person because of race, colour, creed or national origin. F.E.P.C. acts were also adopted in New Jersey, Indiana, Wisconsin and Massachusetts. Georgia repealed its poll tax in 1945.

Two supreme court rulings in 1941 clarified the court's attitude toward contempt proceedings. In Nye v. U.S., 313 U.S. 33, the court overruled an earlier decision and held that a contempt was not punishable unless perpetrated in geographical proximity to the court. In Bridges v. California, 314 U.S. 252, the court by a 5 to 4 vote cleared Harry Bridges and the Los Angeles Times of contempt sentences for their conduct, respectively, in (1) sending a telegram to the secretary of labour denouncing a court decision against Bridges; and (2) publishing editorials praising verdicts of guilty against sit-down strikers and urging the court not to grant them probation while motions for new trial were pending. The supreme court ruled that

there had to be a clear and present danger that out-ofcourt comments on pending cases would obstruct justice before a court was justified in holding critics in contempt. The court applied the same test in a 1946 decision reversing a contempt ruling against a newspaper for criticizing state courts for their failure to enforce the law in cases involving charges against gambling establishments (Pennehamp v. Fla., 66 S. Ct. 1029). (See also Civil Liberties.)

Constitutional Law.—The year 1937 marked the beginning of notable changes in the U.S. supreme court's attitude toward constitutional questions. Construction of federal basic law became both more liberal and more fluid. The old distinctions between legislative, executive and judicial functions of government lost force as such functions were to a large extent merged in certain administrative agencies. The supreme court also renounced to a large extent the supremacy which it had previously asserted over the legislative and executive branches, adopting a handsoff policy toward legislation, both federal and state, and severely limiting its review of administrative agency findings.

The court approved an unprecedented extension of federal power over the social and economic system through legislation affecting almost every phase of production, distribution and labour relations. At the same time it was disinclined to interfere with the powers of the states except where their exercise clearly threatened necessary federal controls or violated rights guaranteed under the U.S. constitution

The supreme court repeatedly overruled its own earlier decisions, stressing the promulgation of sound doctrine as more important than predictability of the law. Thus the court withdrew its prior prohibitions against picketing; approved broad delegations of legislative powers to administrative agencies which it had previously denied; repudiated the view of Swift v. Tyson adhered to since 1840, that there was a federal common law applicable in controversies between citizens of different states and ruled that local state law must be followed by the federal courts in such cases (Erie v. Tompkins, 304 U.S. 64 [1938]); discarded the historical decision in Haddock v. Haddock (201 U.S. 562) that the full faith and credit clause did not require recognition by the states of out-of-state divorces but later watered down the effect of its ruling (see section Marriage and Divorce; Family Relations, below); sanctioned state and federal minimum wage laws for women, nullifying former bans; shifted from the doctrine of reciprocal immunity from taxation between state and federal agencies to the view that both could levy reciprocal nondiscriminatory taxes; approved the multiple taxation of intangibles by the various states in spite of prior contrary rulings; subjected the salaries of federal judges to income taxes, removing a long-enjoyed exemption; reversed itself in the flag salute and handbill cases within the space of 3 years; knocked out a 15-year-old ruling that refusal to bear arms was a ground for denying U.S. citizenship; cancelled state white primary laws which it had once upheld; and approved the Agricultural Adjustment act of 1938 as a proper exercise of the government's police power although it had found the AAA of 1933 to be an abuse of the taxing power.

The supreme court also electrified the legal and business worlds with its 1944 decision in U.S. v. South-eastern Underwriters, 322 U.S. 533, that insurance was commerce subject to the provisions of the antitrust laws; opened a new legal vista by agreeing to entertain an original suit brought by the state of Georgia against 20 railroads to enjoin a conspiracy to fix discriminatory rates (Georgia v.

Pennsylvania R. R. Co. et al., 324 U.S. 439 [1945]); for the first time construed the treason clause of the constitution; made a new application of the due process clause by ruling that the loss of chickens caused by the lights and noise from army bombers was a "taking" of property which entitled the owner to compensation; and unanimously declared an act of congress, which ordered the exclusion of three persons from federal employment, to be a bill of attainder, inflicting punishment without trial, in violation of the constitution (U.S. v. Lovett, 90 U.S. Law Ed. 1052 [1946]).

The concept of interstate commerce was broadened far beyond any previous rulings. It was held to include all activities that may affect the "economics" of interstate commerce. Federal regulation of activities formerly considered local was approved when reasonably necessary for the control and protection of commerce among the states. Thus the wheat marketing quota provisions of the AAA of 1938, as amended in 1941, were applied to wheat intended wholly for consumption on the farm where grown (Wickard v. Filburn, 317 U.S. 111 [1942]); federal regulation of commerce in milk was extended to intrastate transactions where necessary to make interstate controls effective. (U.S. v. Wrightwood Dairy Co., 315 U.S. 110); and wage-hour controls were held to cover employees engaged locally in servicing the buildings of companies producing goods for interstate commerce.

The supreme court, however, tried to reconcile federal and state conflicts over the control of commerce wherever possible through a doctrine of "accommodation" by which it compared the relative weights of the national and local interests involved. It found that California's Agricultural Prorate act which set up a marketing program for the purpose of restricting competition and maintaining prices was not a violation of the Sherman act. State regulations affecting interstate commerce would be sustained, the court said, if the matter seemed to be one appropriate for local control without seriously obstructing the flow of commerce (Parker v. Brown, 317 U.S. 341).

This same attitude of abstention led to the approval of a wide variety of state taxes which to a large extent operated as interstate trade barriers. The court in general approved sales and use taxes on articles bought outside a state for delivery within the state. Retaliation statutes of Missouri and Michigan, prohibiting the importation and sale within their borders of liquor manufactured in other states which discriminated against Missouri- and Michiganmade liquor, were also sustained. On the other hand, obvious attempts by states to levy tariffs on out-of-state products were not tolerated. A Florida act providing for inspection of imported cement and the payment of an inspection fee of 15 cents per 100 lb. was held an unconstitutional burden on interstate commerce (Hale v. Bimco Trading, Inc., 306 U.S. 375 [1939]). So too California's attempt to keep out undesirable immigrants was rebuked by the high court in the so-called "Okie case." A statute making it a misdemeanour to bring a nonresident indigent person into California was held an illegal restraint upon the right of "national citizens" to move from state to state (Edwards v. California, 314 U.S. 160 [1941]).

Among the state statutes approved by the U.S. supreme court were: Virginia's Milk and Cream act establishing a milk commission with power to create within its borders natural market areas, license distributors and fix maximum and minimum prices (Highland Farms Dairy, Inc. v. Agnew, 300 U.S. 608 [1937]); the Washington Minimum

Wage law requiring the payment to women employees of a wage sufficient for their decent maintenance (West Coast Hotel Company v. Parrish (300 U.S. 379 [1937]); the Kansas Filled Milk act; and state liquor laws, including a state monopoly of the sale of liquor for nonbeverage purposes (Walding, etc. Co. v. Department of Liquor Control, 305 U.S. 560 [1938]). But the court struck down as unconstitutional the Oklahoma Criminal Sterilization act because of its discriminatory classification of crimes; the Georgia and Florida "peonage" laws; the Oklahoma Community property law; the Kentucky Escheat act; the Arizona train limit law; and parts of the Texas and Florida union control laws

New constitutions were adopted by Missouri and Georgia.

Criminal Law.—Some progress was made toward modernizing procedures for the trial of accused persons and the treatment of those convicted. The U.S. supreme court adopted rules of criminal procedure under authority delegated by congress in 1933. The new rules went into effect on March 21, 1946, establishing uniform procedure for criminal cases in all federal courts. They were drafted by an advisory committee working in collaboration with lawyers and judges throughout the nation. Among the improvements achieved were the substitution of a new form of indictment for the involved forms in use for a century, a single motion to dismiss in place of various technical motions, the introduction of motions for change of venue and simplification of removal procedure. Proposals for more drastic reforms were rejected.

Only two states made substantial progress toward revising their criminal laws. Louisiana in 1942 adopted a new criminal code which eliminated useless and obsolete terminology, blocked gaps in penal provisions and stated principles in clear, simple language. Forgery, for instance, was defined in a single line. Although the new code abolished minimum sentences and gave trial judges broad discretion in sentencing defendants, it was not especially directed toward reforms in the treatment of criminals. California, on the other hand, in its enactment of a new Penal and Correction Law in 1944 gave recognition to the recommendations of progressive criminologists that more attention should be given to the prevention of crime and the cure of delinquents. The new statute created a department of correction with authority over all state penal and correctional institutes. A board of corrections was created to study the subject of crime-including causes, prevention, apprehension of criminals and methods of prosecution. Some features of the act were inspired by proposals of the American Law institute which in 1940 sponsored a model "Youth Correction Authority act" suitable for adoption by state legislatures. The institute advocated separate treatment of youthful offenders by turning them over to a rehabilitation commission or correction authority instead of sentencing them to prison. Such a commission would have the job of (1) keeping offenders segregated as long as they might be dangerous to society, (2) investigating the causes of their criminality and trying to correct them through training and (3) keeping watch over offenders after their release, not only to prevent recidivism but also to assist their rehabilitation through counsel and financial help. The institute supplemented this plan in 1941 by the publication of a model "Youth Court act" laying out the framework for a specialized court to try offenders under

Congress made it possible for federal judges to give spe-

cial consideration to youthful defendants in criminal cases. Under the Juvenile Delinquency act (1938) any juvenile 17 years of age or under, charged with an offense against U.S. laws not punishable by death or life imprisonment, might be put on probation or committed to the custody of the attorney general, if the accused waived a jury trial and consented to such procedure.

Progress was also made toward a nation-wide system to aid rehabilitation of paroled convicts. Thirty-nine states signed the Interstate Parole and Probation compact. Through a system of state administrators it became possible for a parolee to "begin life over" in a new state under improved conditions, subject to safeguards against the abuse of the system to evade the authority of the state where the parolee was originally convicted.

The scope of the federal criminal law was somewhat enlarged through statutes creating new offenses, including several with respect to interstate commerce, a 1946 amendment sharpening the teeth of the Anti-Racketeering act of 1934, and the Anti-Lobbying act of 1946.

The supreme court ruled that plural or "celestial" marriages between members of the Fundamentalist cult of the Mormon faith did not violate the federal Kidnapping act even though such marriages involved the transportation of women, some of them minors, for immoral purposes, since there had been no involuntary seizure or detention (Chatwin v. U.S., 14 LW 4659 [1946]). But the transportation of "plural" wives across state lines by members of the same cult was held to violate the Mann act (Cleveland v. U.S., 15 LW 4004 [1946]).

In the much-cited case of McNabb v. U.S., 318 U.S. 332 (1943) the supreme court created a new rule of evidence. Three members of a clan of Tennessee mountaineers had been sentenced to 45 years imprisonment for the murder of a "revenuer." Confessions were obtained from the defendants during two days while they were held for questioning before being brought before a U.S. commissioner for commitment as provided by statute. The high court said that such confessions could not properly be used against the defendants because they were obtained by a flagrant disregard of the arresting officers' duty to take the defendants before a magistrate. The effect of this ruling was whittled down considerably by later federal and state court decisions. The mere holding of a suspect for a protracted period before arraignment was held not to invalidate a voluntary confession where there was no coercion (U.S. v. Mitchell, 322 U.S. 65 [1944]).

In a series of cases the supreme court held that the failure of trial judges to appoint counsel for defendants in criminal cases was a denial of due process even though the defendant did not ask for counsel and had no funds to pay for such service, nor did a defendant waive this right by pleading guilty. He might, however, expressly waive his right to counsel as well as his right to a jury trial, even though he had not had the advice of counsel.

War Crimes.—With the threat of rising nazi and fascist power, democracy faced the problem of curbing the activities of pro-axis organizations and agencies without destroying the civil liberties. Sedition provisions of the Espionage act of 1917, operative only in wartime, were supplemented by the Alien Registration act of 1940, which contained drastic provisions against subversive activities in peacetime as well as during war. The Selective Service act of 1940 also made it a crime to counsel or abet another to evade registration or service. The leader of the "Silver Shirts," William Dudley Pelley, was convicted under the sedition laws for pro-Japanese and pro-German activities after the outbreak of war. The much-publicized trial of

29 defendants at Washington, D.C., for violation of sedition laws was ended, however, by the death of the presiding judge, and in 1946 the case was dismissed in spite, of objections by the attorney general.

Two convictions for pro-nazi activities were reversed by the U.S. supreme court. In one case, evidence was held insufficient to prove a conspiracy to acquire and export gold bullion to Germany without a licence (Bates v. U.S., 323 U.S. 15 [1944]). In the other case, the defendant had been found guilty of violating the 1917 espionage act by writing and circulating pamphlets libelling the president, attacking the British and the Jews and calling for a nazi victory, with intent to obstruct recruiting and enlistment and to cause disloyalty among the armed forces. But the conviction was set aside by a 5 to 4 decision. While characterizing the pamphlets as unreasoning and vicious appeals to prejudice, the court ruled that the government had not proved beyond a reasonable doubt that the defendant intended to undermine the morale and loyalty of the armed forces (Hartzel v. U.S., 322 U.S. 680 [1944]).

In another 5 to 4 decision, the supreme court reversed the conviction of 24 members of the German-American bund for violating the Selective Service act. The defendants had advised members of their society to refuse military duty until congress should repeal a provision of the act prejudicial to bund members seeking employment. This in itself did not constitute counsel to "evade" service, the court held. Nor was the fact that the accused were pro-German and opposed the entry of the United States into the war a violation of the act (Keegan v. U.S., 325 U.S. 478 [1945]).

For the first time in its history, the supreme court rendered a decision on the subject of treason. By a 5 to 4 vote, the court reversed the conviction of Anthony Cramer, a naturalized citizen of German birth, charged with giving aid and comfort to the enemy in meeting, drinking and conferring with two of the German saboteurs who were landed from a submarine in 1942. There was evidence that the accused was pro-nazi, knew or believed that he was dealing with saboteurs and had accepted more than \$3,000 in currency to be held for the use of the saboteurs. But the supreme court held that his conviction for treason did not rest "on the testimony of two witnesses to the same overt act" as required by article iii section 3, of the federal constitution (Cramer v. U.S., 325 U.S. 1 [1945]). (See also Federal Bureau of Investigation.)

Housing.—The movement for slum clearance and lowcost housing, born of depression years, resulted in the National Housing act of 1937, establishing the U.S. Housing authority. Previous measures had been directed mostly toward spreading employment by making loans available for home building. The 1937 act, however, was intended not only to relieve unemployment but to inaugurate a national program for the elimination of slum areas and the erection of decent housing for low-income families. Funds were made available, through credits and subsidies, for use by state-created agencies under state laws to be integrated with the federal statute. To qualify for federal grants, such state legislation was required to provide for demolition or repair of houses dangerous to public health and safety. The role of the national government was that of financier. Exercise of the power of eminent domain was left to the states and their agencies.

All but a few states enacted urban redevelopment laws, co-ordinated with the National Housing act of 1937. State courts uniformly upheld the right of local housing authorities to condemn land under such laws as a proper extension of recognized governmental powers to protect public

health, safety and morals and to promote the general welfare. The high courts of Massachusetts, New York and Illinois also upheld the right of their legislatures to delegate the power of eminent domain to private profitmaking corporations for the purpose of slum clearance.

The exemption of public housing projects from taxation was generally approved except in Ohio, where the supreme court ruled that a state housing project was not "public property used exclusively for any public purpose" within the meaning of a constitutional provision covering tax exemptions. The attempt of local authorities to tax a housing project built on federally-owned land was thwarted, however, by the U.S. supreme court, which sustained the power of congress to exempt such property from state taxation under the National Housing act of 1937 (Cleveland v. U.S., 323 U.S. 329 [1945]).

In 1940 congress enacted the Defense Housing act to relieve the plight of armed service personnel and defense workers uprooted and homeless because of participation in defense preparations. The war and navy departments, aided by the U.S. Housing authority, were authorized to provide the needed dwellings for officers, enlisted men and civilian employees of the army and navy. The Federal Works administrator was directed to provide housing for other defense workers.

The suspension of long-term housing projects because of defense and war activities further intensified the shortage of shelter, which became critical with the return of servicemen at the war's end. The Servicemen's Readjustment act of 1944 (G.I. Bill of Rights) gave federal support to loan agencies in financing home-buying by veterans, but material and labour still were lacking to provide the much-needed housing. The Veterans Emergency Housing act was passed in 1946 in an effort to ease the situation. It created the office of housing expediter with authority to allocate housing materials under priorities for veterans, establish price ceilings on new houses, make incentive payment to stimulate production of materials, authorize Federal Housing administration insurance on mortgage loans for the construction of housing for veterans and guarantee markets on new types of building materials and prefabricated houses. (See also Housing.)

Labour Relations.-The Roosevelt administration was especially marked for the boost given to organized labour. It should be recalled, however, that the way had been prepared by a Republican congress in 1932 with the passage of the Norris-La Guardia act banning the issuance of injunctions by federal courts against peaceful striking or picketing. The resulting advantage to labour was vastly reinforced by three New Deal laws: (1) The National Labor Relations or Wagner act, enacted in 1935, which improved the bargaining position of labour, (2) the Byrnes Anti-strikebreakers act of 1936, amended in 1938, which made it a felony to transport any person in interstate commerce for the purpose of interfering with peaceful picketing or the collective bargaining process; and (3) the Fair Labor Standards act of 1938, which extended broad federal controls to wages and hours. Defense and war production brought a voluntary strike truce in industries contributing to such effort; and in 1943 congress sought to prevent any breach of this truce through the passage of the Smith-Connally act designed to avoid work stoppages in war production. This antistrike law was one of three federal enactments which could be construed as hostile to labour. The other two came after the war's end. The "Anti-Petrillo" act of 1946 amended the Communications

act by making it a felony for anyone to coerce radio broadcasters into hiring more employees than they considered necessary. In the same year, congress added teeth to the Anti-racketeering act of 1934 through amendments which labour leaders feared would be used for strikebreaking.

NLRA. Labour's improved position was assured in 1937, when the supreme court in five comprehensive decisions found the Wagner act constitutional. This law was designed to equalize bargaining power between employees and management by (1) preventing unfair labour practices and (2) protecting the right of employees to organize and bargain collectively. Unfair labour practices were defined, and machinery was provided for the election of worker representatives to deal with management on behalf of a particular bargaining unit. The National Labor Relations board, created to administer these provisions, was not given any power to mediate labour disputes. That function remained with the secretary of labour and the conciliation service of the labour department. Nor did the NLRA cover agricultural workers or railway employees.

In its 1937 decisions, the supreme court held that the NLRA applied not only to transactions in the direct flow of interstate commerce, but also to concerns engaged in manufacturing and production where interstate commerce was affected. Companies which bought raw materials and sold finished products outside their home states were clearly subject to the act. Employees held to come within the NLRA included steel plant workers (NLRB v. Jones and Laughlin Steel Corp., 301 U.S. 1); employees of a trailer manufacturer (NLRB v. Fruehauf Co., 301 U.S. 49); clothing workers (NLRB v. Friedman etc. Co., 301 U.S. 58); employees of a newspaper press association (AP v. NLRB, 301 U.S. 103); and interstate bus drivers (Washington Coach Co. v. NLRB, 301 U.S. 142). A year later the court rejected the place of origin of raw materials and the comparative percentages of interstate and intrastate business transacted by employers as factors determining the jurisdiction of the labour board. No mathematical line could be drawn, the court said (Santa Cruz Co. v. NLRB, 303 U.S. 453). Subsequent decisions continued to support a broad application of the NLRA.

Rulings of the labour relations board directed against unfair labour practices were generally sustained by the supreme court, which supported the broad power of the board to order such affirmative action as might be necessary to carry out the policies of the Wagner act. Various types of activities were held to be unlawful restraint or coercion of employees in their right to organize themselves and to bargain collectively over wages, hours and working conditions through representatives of their own choosing. The supreme court upheld the NLRB in requiring an employer to withdraw recognition of a company union and to post notices of such withdrawal (NLRB v. Pacific Greyhound Lines, 303 U.S. 272 [1938]); in directing the disestablishment of a company-dominated union, the reimbursement of dues checked off to that union and the reinstatement of employees (Va. El. & Power Co. v. NLRB, 319 U.S. 533 [1944]); in ordering an employer to bargain with a union even though it had lost its majority status after the employer had refused to bargain with it (Franks Bros. Co. v. NLRB, 321 U.S. 702 [1944]); and in directing corporations to abandon plant rulings forbidding employees to wear union buttons, solicit union membership or distribute handbills on company premises during nonworking time. The attempt of an employer to by-pass a union, designated as bargaining agent, by entering into

separate contracts with individual employees was also stigmatized by the supreme court as a violation of the NLRA (Case Co. v. NLRB [1946]).

The labour relations board was not only charged with the duty of preventing unfair practices, but also with making effective the right of labour to bargain collectively through representatives chosen by the majority of workers in a particular bargaining unit determined by the board. The right to bargain collectively, thus guaranteed, was consistently upheld by the supreme court, which said that while employers had a right to conduct their business without being subjected to arbitrary restraints "employees have their co-relative right to organize for the purpose of securing the redress of grievances and to promote agreement with employers relating to rates of pay and conditions of work" (Va. Ry. v. Federation No. 40, 300 U.S. 515 [1937]). The court also ruled that once a bargain had been reached, a union was entitled to have it put in writing. Refusal of the employer to sign was a violation of the NLRA (Heinz Co. v. NLRB, 311 U.S. 514 [1941]).

Freedom of a majority of workers in the election of their bargaining representatives was held to be a necessary corollary to their right to bargain collectively. NLRB orders certifying unions as bargaining agents or setting aside elections because of interference by employers were with few exceptions affirmed by the courts.

The right to picket peacefully was firmly established in Thornhill v. Ala., 310 U.S. 88 (1940), as a proper exercise of the right of free speech. The court knocked out a state law forbidding picketing. The supreme courts of California and Michigan also invalidated local ordinances against picketing. Furthermore, the U.S. supreme court approved 'stranger" picketing by nonemployees in order to bring pressure for the unionization of an open shop (A.F.L. v.Swing, 312 U.S. 321 [1941]). Picketing, however, would come within the free speech guarantee only as long as it remained peaceful. If set in a background of violence, picketing might be enjoined (Milk Wagon Drivers v. Meadowmoor Dairies, 312 U.S. 287 [1941]). Abuse of the right to picket, falling far short of violence, did not justify an injunction. Mere misrepresentations on signs carried by pickets were not an unlawful abuse of rights (Cafeteria Union v. Angelos, 320 U.S. 293).

The right to strike was also sustained by the supreme court provided it was exercised within lawful limitations. Sit-down strikes involving the seizure of company property were outlawed (NLRB v. Fansteel Corp., 306 U.S. 240 [1939]). In fact, the court insisted that management not only had the right to have violent picketing and sit-down strikes enjoined, but that it retained other substantial rights such as the right to hire and fire, to demote and transfer employees, to state its preference among unions and to exercise the right of free speech, provided such rights were not unreasonably used to coerce employees in violation of the Wagner act. (See also National Labor Relations Board).

Labour and Antitrust Laws.—Labour organizations were not wholly excluded from the operation of the antitrust laws, according to the supreme court, but the decisions of a majority of the justices greatly narrowed the application of such laws to union activities. In Apex Hosiery Co. v. Leader, 310 U.S. 469 (1940) an employer brought suit under the Sherman act to recover treble damages from a union and its officers for injuries caused to its plant and business by sit-down strikers. The court ruled that the mere stoppage of interstate shipments was not a restraint on commerce within the meaning of the Sherman act unless there was a showing that it curtailed competition by

affecting market prices. This decision was amplified by U.S. v. Hutcheson, 312 U.S. 219 (1941) in which the court held that boycotting and picketing against an employer engaged in interstate commerce are not violations of the Sherman act "so long as a union acts in its own self-interest and does not combine with non-labour groups." Such activities were protected from prosecution in the light of interrelating provisions of the Sherman, Clayton and Norris-La Guardia acts.

So too, in a much-criticized decision, the court ruled that a combination of workers acting alone was exempt from the operation of federal antitrust laws even though their action might ruin the business of a particular employer (Hunt v. Crumboch, 65 S. Ct. 1545). But their immunity ceased as soon as they combined with others outside their membership. A combination of unions, manufacturers and contractors to create a monopoly in electrical equipment in the New York city area through a boycott of goods produced elsewhere was properly enjoined as a violation of the Sherman act (Bradley Co. v. Local No. 3, 65 S. Ct. 1533).

State Laws.—While one group of states, including Connecticut, Massachusetts, Michigan, Minnesota, New York, Pennsylvania, Utah and Wisconsin, adopted laws guaranteeing labour the right to organize and bargain collectively, another group tried to crack down on unions through restrictive statutes. State labour relations laws, even in the first group, tended to be less liberal to labour than the Wagner act. Issues were raised in some cases over the jurisdiction of state and federal labour boards. The U.S. supreme court held that the states were not excluded by the NLRA from exercising police power over union activities, and the Wisconsin supreme court indicated that a workable compromise could be reached. but neither state nor federal courts arrived at any test which could be easily applied where jurisdiction conflicted or overlapped.

The federal high court, however, struck out state labour laws infringing freedom of speech and assembly. The court reversed the conviction by a Texas court of R. J. Thomas, United Automobile Workers president, for addressing a labour rally without first obtaining an organizer's card as provided by the state's union control act. Requirements that paid labour organizers obtain and carry state registration cards while soliciting membership were held to be invalid, but provisions prohibiting aliens and felons from serving as union officers or organizers, barring union contributions to political parties and candidates and requiring unions to keep financial records open to members and state officials were not disturbed (Thomas v. Collins, 65 S. Ct. 315).

The supreme court also swept aside provisions of the Florida union control law as repugnant to the Wagner act. Sections of the statute limiting unions in the choice of business agents to persons who could show citizenship and ten years' U.S. residence and giving courts the power to enjoin unions from all activities in the state for noncompliance with various statutory requirements were held to infringe the freedom to bargain collectively guaranteed by the NLRA (Hill v. Watson, 65 S. Ct. 1373).

Railway Labour.—Machinery for the peaceful settlement of disputes between railway labour and management operated under the Railway Labor act of 1926, as amended in 1934. The act guaranteed the right of employees to bargain collectively through representatives of their own choosing. Coercive interference either by labour groups or management in the process of selecting representatives was forbidden. The act was designed to foster the friendly

adjustment of disputes between the parties themselves. Where that failed, all questions over the interpretation of agreements between labour and management were first referred to the National Railroad Adjustment board. Another agency, the National Mediation board, stood ready to furnish mediation and conciliation facilities where disputes broke out over pay, rules and working conditions. The same board also exercised control over employee elections and the certification of bargaining representatives. Arbitration under the act remained purely voluntary, however. Constitutionality of the Railway Labor act was sustained by the supreme court in Va. Ry. v. System Federation No. 40, 300 U.S. 515 (1937) and other decisions.

In May 1942 the president created the National Railway Labor panel as an emergency fact-finding body to assist in the settlement of railway labour disputes which might affect war production.

War Labor Disputes Act.-In an effort to avert strikes in defense plants, the president created the National Defense Mediation board in March 1941 to negotiate the settlement of disputes referred to it by the secretary of labour. But this agency seemed inadequate to meet the perils of work stoppage after U.S. entry into World War II. The president therefore replaced it in Jan. 1942 with the National War Labor board after a conference with leaders of labour and management at which both sides agreed to refrain from strikes and lock-outs during the war emergency and to submit disputes to the proposed new agency. The WLB included representatives of the public, labour and employers. It proceeded to exercise jurisdiction on its own motion over a wide variety of disputes with the assumption that its findings were final and binding. In 1942, when the president was empowered by statute to stabilize prices, wages and salaries, he turned this function over to the WLB.

The Smith-Connally or War Labor Disputes act, effective July 1, 1943, gave statutory recognition to the WLB, establishing its jurisdiction to decide wages, hours and all other issues in any labour disputes which might lead to substantial interference with the war effort. The act also provided that when a strike was threatened in a war plant, the workers' representatives were required to notify the secretary of labour, the War Labor board and the National Labor Relations board, and submit a statement of the issues involved. Production was required to continue for the next 30 days. If the dispute was not settled during this cooling-off period, then on the 30th day the NLRB would take a secret vote to determine whether a majority of the workers wished to strike. The president was empowered to take possession of any war plant on behalf of the government whenever its operation should be interrupted by a labour disturbance. The plant had to be returned to its owners, however, within a period of 60 days after the restoration of its productive efficiency. The act also made it a crime to induce or instigate a strike, lock-out, slowdown or other interference with the operation of a government-controlled plant.

The WLB in general avoided conflicts with previously established labour tribunals. It adopted a policy of non-interference with the authority of the NLRB over unfair practices affecting commerce and with the National Mediation board over labour problems involving railways and their employees. The WLB did not attempt to invade the jurisdiction of the NLRB by conducting elections to select collective bargaining agents or by ordering the cessation of unfair labour practices. It did, however, take the posi-

tion that its jurisdiction was not limited to labour disputes affecting interstate commerce, maintaining that its authority was derived from the war powers of the president under the constitution.

The status of the WLB was at issue in a long-fought war between the government and Montgomery Ward and Co. over WLB directives for the maintenance of union membership, wage increases and machinery for arbitrating grievances in a contract with a C.I.O. union. In 1944 the government seized the company's properties in Chicago, Ill., and six other cities under a presidential order which declared that Ward's labour policies were impeding the war effort. A federal court held the seizure to be a proper exercise of the president's war powers under the Smith-Connally act. But the government's victory was fleeting. When the case reached the supreme court late in 1945, it was dismissed as moot, since the emergency of war production had ended.

The decade ended with public attention focused on a labour-management drama in which John L. Lewis, president of the United Mine Workers, held the centre of the stage. A U.S. district judge had issued an injunction restraining Lewis and his union from breaking a contract with the government in connection with the operation of soft coal mines and from striking against the government. The miners ignored this order, however, on the ground that it was unconstitutional and violated the Norris-La Guardia act. The court then entered a fine of \$3,500,000 against the union and \$10,000 against its president for contempt of court. The supreme court agreed to review both the injunction and contempt proceedings.

(See also LABOUR UNIONS; STRIKES AND LOCK-OUTS.)

Marriage and Divorce; Family Relations.-The hope of creating order and uniformity in the welter of statutes and decisions on family relations in the 48 states found little support in the courts and legislatures. Recommendations of the Commissioners on Uniform State Laws were generally disregarded. Laws requiring premarital medical tests to show freedom from venereal disease were enacted, however, under pressure from medical organizations in a steadily enlarging group of states, including New York, Massachusetts, Illinois, California and others containing large urban populations. The desire for hasty marriages, stimulated by war conditions, created new problems. Proxy marriages between members of the armed forces overseas and their betrothed in the United States were generally frowned upon by public officials. A study made by the National Association of Legal Aid bureaus indicated that no state except possibly Kansas would hold such marriage legal. Long-distance marriages in which the parties participated directly by telephone or cable seemed more likely to win court approval.

A sharp rise in divorce actions followed the mounting curve of defense and war production. With the general higher level of earnings, divorce apparently was no longer considered a luxury item. The trend in trial courts was toward more liberal construction of divorce grounds. Many judges were inclined to extend the definition of cruelty to include conduct impairing the health of a spouse, bodily or mental, even though not caused by physical violence. Several states also made separation without cohabitation for a specified number of years a ground for divorce without proof of desertion. Two decisions of the U.S. supreme court in the celebrated Williams case made divorce law history. This case originated in North Carolina where a man and woman were convicted of "bigamous

cohabitation." The defendants, originally residents of North Carolina, had each obtained divorces in Nevada from their respective spouses, then married each other and returned to North Carolina, where they lived together as man and wife. The Nevada divorces had been obtained in proceedings based on "substituted service," that is, notice to the defendants in North Carolina was given by publication in a Nevada newspaper. The supreme court held in 1942 that since such service fulfilled the requirements of Nevada law, full faith and credit required North Carolina to recognize the Nevada decrees, thus overruling its famous 1906 decision in the Haddock case (Williams v. N.C., 317 U.S. 287). The court, however, did not pass on the question whether the Nevada decrees had been based on bona fide residence of the plaintiffs in that state. Trial courts therefore generally held that the Williams decision merely eliminated the requirement of personal service on the defendant in out-of-state divorces, and that it did not preclude them from denying the validity of such divorces where neither of the spouses was genuinely domiciled in the state granting the divorce. This view was confirmed by the supreme court when the Williams case reached it again in 1945. A second prosecution of the same parties in North Carolina had resulted in their conviction based on evidence that their Nevada divorces were invalid because they had not acquired bona fide domicile in that state. The supreme court affirmed this decision on the ground that every state had the right to inquire into jurisdictional facts in connection with divorce decrees granted by other states (Williams v. N.C., 325 U.S. 226). As a result the status of "migratory divorces" remained precarious except where the court obtained jurisdiction upon actual residence of the plaintiff established in good faith and not merely for the purpose of divorce.

An Illinois statute purporting to bar "heart balm" suits (for alienation of affections) was held unconstitutional by the state supreme court on the ground that it violated the guarantee of the Illinois constitution that every person should have a remedy for his injuries and wrongs (Hecht v. Schupp, 68 N.E. 2nd, 464 [1946]).

New legal ground was broken by a U.S. circuit court when it approved a suit brought on behalf of children against a woman who was alleged to have persuaded their father to leave them and their mother and to refuse to support them. The court held that such an action came within the principles of the common law which could properly be applied to new situations as they arose, even though there was no specific authority for such an action in court decisions or statutes (Daily v. Parker, 152 F. 2d 174). (See also Marriage and Divorce.)

Military Justice.—The number of soldiers tried by court martial during World War II averaged only 3 out of every 1,000 in the U.S. army as compared with a rate three times as great in World War I. Public protests against harsh sentences and other abuses stimulated proposals for changes in military law and procedure. The secretary of war announced in 1945 that 27,500 convictions would be reviewed by special clemency boards for the purpose of adjusting unfair and unduly severe sentences. The postwar trial of officers charged with brutal treatment of prisoners in the U.S. military prison at Litchfield, England, resulted in mild sentences for the commanding officer and some of his subordinates.

One of the most dramatic events in supreme court history was the calling of a special session in midsummer 1942 to hear the petitions for habeas corpus of nazi saboteurs who had been arrested after landing on U.S. shores from submarines. The court ruled that they could prop-

erly be tried by a military commission appointed by the president. They were spies and not entitled to the status of prisoners of war nor to a jury trial. The commission found all of the defendants guilty. Six were executed, two imprisoned (U.S. ex rel. Quirin v. Cox, 317 U.S. 1). The high court also denied writs of habeas corpus to the Japanese generals, Tomoyuki Yamashita and Masaharu Homma, who were condemned to death by military commissions for war atrocities. A majority of six justices found the procedure to be constitutional, but Justices Wiley Rutledge and Frank Murphy, dissenting, characterized the trials as unprecedented deprivations of basic rights (Yamashita v. Styer, 327 U.S. 1 [1945]).

Civil courts in general gave precedence to military tribunals in the prosecution of their own personnel for crimes during wartime even though committed against civilians. But the jurisdiction of military courts over offenses by servicemen against state laws was held not to be exclusive. Nor was military jurisdiction over a registrant under the Selective Service act to begin until he was actually inducted. He was subject to prosecution only in civil courts (Billings v. Truesdell, 321 U.S. 542 [1944]).

The most significant conflict between civil and military authorities arose in Hawaii, where martial law was declared Dec. 7, 1941, and continued until Oct. 24, 1944. Cases involving thousands of civilians were tried by military courts, and the writ of habeas corpus was suspended. The supreme court, however, ruled in a 6 to 2 decision that this was a usurpation of power. Court-martial sentences against a Honolulu business man for embezzlement and a naval workman for assault on marine corps sentries were held to be illegal. The organic act which created the territory of Hawaii permitted the declaration of martial law under threat of invasion, but it did not deprive Hawaiian citizens of constitutional rights enjoyed by citizens of the states. Declaration of martial law did not give military authorities the right to take over the functions of civil courts even in wartime (White v. Steer and Duncan v. Kahanamoku, 327 U.S. 304 [1946]).

Patents, Trade-Marks and Copyrights.—Alarm over the extent to which patent rights had been used to establish monopolistic controls over entire industries, both on national and international scales, stimulated government prosecutions under the antitrust laws. (See section Business Regulation, above.)

In 1940 congress tightened provisions of a 1917 statute which authorized the commissioner of patents in wartime to keep an invention secret and to withhold the grant of a patent where he might deem disclosure of an invention to be "detrimental to the public safety or defense." The 1940 amendment, effective for two years, removed the wartime limitation, provided for protection of the inventor's property rights and imposed heavy penalties for violations of secrecy orders. Further patent law amendments in 1942 provided for the adjustment of royalty rates to be paid on patented articles manufactured in war production.

In 1943 the National Patent Planning commission, established by executive order in 1941, issued a report proposing changes in the law. Among them were provisions for the recording of all patent agreements with the patent office, so that secret, improper and illegal agreements might be exposed; for the cancellation of patents which later information showed should not have been issued; for a public register of patents under which the owners were willing to grant licences on reasonable terms; for establishing an objective test for the patentability of an invention on the basis of its value in advancing the arts and

sciences; and for the designation of the court of customs and patent appeals as the sole tribunal to review the denial of a patent by the patent office. Congress, however, did not enact these proposals. But the rules of practice in the patent office were revised in 1945.

The Atomic Energy act of 1946 prohibited the granting of patents for any invention or discovery useful solely in the production of fissionable material; required that such inventions or discoveries be reported to the commission created by the act; and authorized the commission to take over and pay just compensation for such inventions and discoveries. Another 1946 enactment temporarily extended time for filing patent applications in connection with rights which lapsed during World War II.

Trade-mark decisions exhibited the same general emphasis on the public interest as in the patent cases. That interest could best be served through the relatively free play of competition, the courts frequently said. They were therefore inclined to be less generous in protecting claimants against the infringement of trade-marks and names than in previous periods.

The entire law of trade-marks was revised by the Lanham act, passed by congress in 1946 to become effective July 5, 1947. This new statute codified all trade-mark laws, extended trade-mark protection to the identification of services as well as goods, increased the benefits derived from registration and gave trade-marks an independent status as property. Among other innovations was the right to register sound trade-marks such as the musical "signatures" identifying radio program sponsors.

The registration of copyrights of prints and labels was transferred on July 1, 1940, from the patent office to the Library of Congress, thus ending the last connection of the patent office with copyrights. Efforts to get congress to modernize the copyright laws by extending more adequate protection to creative material published through motion pictures, radio and television, were unsuccessful. Amendments in 1940 covered the renewal of copyrights on contributions appearing in periodicals and the prevention of importation of infringing material. A further amendment in 1941 provided for the preservation of the rights of authors threatened with loss of protection caused by disruption of communications during the war emergency. The rules and regulations for the registration of copyrights were amended in 1942. (See also COPYRIGHT; PATENTS.)

Reconversion.—Congress in 1944 enacted a series of laws designed to control the change-over from war to peacetime production and to ease the strain of the readjustment upon industry, farmers and servicemen. The disastrous effects which might follow the unregulated termination of thousands of war contracts and subcontracts were provided against in the Contract Settlement act, which created the Office of Contract Settlement to work out speedy and equitable final settlement of claims under terminated war contracts and adequate interim financing during such settlement. The Servicemen's Readjustment act (G.I. Bill of Rights) was designed to help veterans re-establish themselves in civilian life. (See section War Powers and Controls, below.)

The Surplus Property act set up machinery to handle the disposal of war plants, surplus agricultural commodities, real estate and other goods no longer needed for war purposes. This job was first assigned to the Surplus Property board, which was later replaced by a single administrator. On Feb. 1, 1946, the Surplus Property administra-

tion was merged with the War Assets corporation, a subsidiary of the Reconstruction Finance corporation; and as of March 25, 1946, the War Assets administration assumed the functions of the War Assets corporation.

The War Mobilization and Reconversion act established the Office of War Mobilization and Reconversion, headed by a director, with authority over the previously created Office of Contract Settlement, the Surplus Property board and the Retraining and Re-employment administration. Policies for demobilization and reconversion laid down by the act included provisions that members of the armed forces should not be retained in service for the purpose of preventing unemployment or to await opportunities for employment; that contracting agencies should terminate contracts as soon as their production was not needed for the war and should not continue performance merely to provide employment; that the termination of war contracts should be integrated and synchronized with the resumption of production for civilian purposes; and that there should be no discrimination against small business concerns either in permitting the resumption of nonwar production or the allocation of materials to them for that purpose. The act also provided for advances by the government to state unemployment funds and to state agencies for the construction of public works, not including hous-

Shortly after the end of hostilities in 1945, the president stated that reconversion policies would be: (a) to assist in maximum production of goods and services for domestic and foreign needs through allocations of materials, conversion of war plants and job placement of war workers and veterans; (b) to continue economic stabilization by using the powers conferred under the Emergency Price Control and Stabilization acts of 1942, subject to reasonable modification, and (c) to move as quickly as possible toward removal of price, wage, production and other controls and the restoration of collective bargaining and a free market.

Certain war agencies were terminated at once, and the functions of others were shifted to more permanent departments. Among the agencies abolished were the Office of War Mobilization, the War Manpower commission and the War Production board. The duties and powers of the latter were turned over to the newly created Civilian Production administration. On Jan. 4, 1946, the president appointed a director of liquidation in the Office for Emergency Management to expedite the closing out of war agencies; and on Dec. 12, 1946, the president abolished the Office of War Mobilization, the Office of Price Administration, the Civilian Production administration, the Office of Economic Stabilization and the National Wage Stabilization board, transferring most of their remaining functions to the Office of Temporary Controls headed by the federal works administrator.

Although the reconversion program was directed toward terminating war agencies as rapidly as possible, the war's end did not mean the end of all emergency laws. The attorney general announced that federal statutes effective only "in time of war," "during the present war" or "for the duration of the war" would remain alive until the signing of a formal peace treaty, unless terminated sooner by appropriate government action. Statutes effective until "the end of the emergency" or "the cessation of hostilities" could be terminated only upon proclamation by the president. Such a proclamation, announced on the last day of 1946, had the effect of terminating 20 emergency laws at

once, 15 at the end of 6 months thereafter, 10 at the end of 1 year, and 8 at the end of periods of more than 1 year.

Priorities, allocations, rationing and price and rent controls continued to a limited and diminishing extent during the reconversion period under policies laid down by the president, namely: the expansion of the production of materials in short supply; the granting of priorities to break bottlenecks which impeded the reconversion process; the control of inventories to avoid hoarding and unbalanced distribution; and the allocation of scarce materials necessary to the production of low-priced items required for the success of the postwar stabilization program.

Priority and allocation powers were in general continued until March 31, 1947, and the allocation of building material until June 30, 1947, through the extension of the Second War Powers act in 1946. Food controls were ended except the rationing of sugar and rice and except the controls exercised by the secretary of agriculture over food production and distribution in order to permit the allocation of food to famine areas and the equalization of domestic shortages. Construction priorities were assigned to the housing expediter under the Veterans Emergency Housing act of 1946. (See section *Housing*, above.)

The Emergency Price Control act expired on June 30, 1946. After a brief hiatus, during which the Office of Price Administration continued to exercise some powers under the Second War Powers act, the president on July 25, 1946, signed an act extending rent control and limited price control until June 30, 1947, with provisions for the rapid decontrol of prices. Price ceilings were removed by the end of the decade except as to sugar.

In response to pressure for a "full employment" law. congress adopted a compromise measure, the Employment act of 1946, declaring it to be the national policy to coordinate and utilize all functions and resources to create and maintain conditions promoting maximum employment, production and purchasing power. It required the president to report to each session of congress on the economic condition of the nation with specific recommendations. It also created a council of economic advisers to assist the president in preparing such reports and a joint committee of senators and representatives to consider the president's recommendations. (See also War Production.)

Social Security and Health.-In 1937 the U.S. supreme court in a series of decisions made social security legally safe by approving the Social Security act of 1935. This major feature of the New Deal plan to banish the fear of want provided protection against dependency due to unemployment, old age and other causes. It set up a system of unemployment insurance, financed through co-ordinated federal and state laws imposing taxes on employers based on the amount of wages paid in certain employments. Secondly, it created a purely federal system of old-age and survivors' insurance financed through a tax on employers and deductions from wages. A third section of the law authorized grants to the states for aid to dependent children, maternity and child welfare, public health work and the needy blind. The supreme court upheld the pay roll tax on employers for the support of unemployment compensation as a proper excise tax and not an illegal coercion of state governments (Steward Machine Co. v. Davis, 301 U.S. 598). The court further ruled that state unemployment compensation laws, keyed into the federal system, were constitutional (Carmichael v. So. Coal and Coke Co., 301 U.S. 495); and it also approved the old-age benefits feature, including the taxes imposed to support it (Helvering, etc. v. Davis, 301 U.S. 619).

The application of this new legislation required inter-

pretation by the courts. Bonuses, commissions and board and lodgings furnished to employees were generally held to be wages. Disputes over the definition of the employment relationship also led to much litigation. The trend was to apply common-law concepts in determining whether a person was an employee or an independent contractor. Thus the absence or presence of control, both over the result of his work and the method of achieving it, was often held to be a decisive factor. Absence of such control, however, was not always held to exclude a case from operation of the statute. The courts tried to look behind the contract between the parties to their actual relationship.

Social security for railroad employees was provided by separate enactments. The Railroad Retirement act of 1937 assured annuities to retired railroad workers and their dependents. The Railroad Unemployment Insurance act of 1938, amended in 1939, set up a pooled-fund system of unemployment insurance for the same group. Administration of both statutes was assigned to the Railroad Retirement board.

Congress also expanded and strengthened the U.S. public health service through two enactments in 1939, one establishing a National Cancer institute and the other regulating the sale of viruses, serums, toxins and antitoxins. The Public Health Service act of 1944 revised and consolidated federal laws relating to public health and reorganized the PHS, bringing it under the administration of the Federal Security agency. The public health service was further supplemented by the National Mental Health act of 1946 establishing the National Institute of Mental Health for research and development of more effective methods of preventing mental disease. The act also authorized grants to the states to aid them in similar work. Agitation for extending social security to include health insurance provisions found expression in the Murray-Wagner-Dingell bill, which failed of passage.

Other social security legislation in 1946 included: (1) amendments to the Railroad Retirement act, which increased the tax rate, made changes as to benefits and eliminated certain inequities; (2) amendments to the Social Security act enlarging and extending certain provisions; (3) passage of the Employment act, which directed the president to make annual reports on the economic condition of the nation to congress, set up an economic council to assist in the work and announced it to be the natural policy to promote free competitive enterprise and maximum employment, production and purchasing power; and (4) the National School Lunch act, which provided for federal grants-in-aid to assist the states in establishing and operating a nonprofit school lunch program. (See Social SECURITY.)

Taxation.—Expanding governmental activities, federal, state and local, brought more and stiffer tax laws with steeply rising rates and new devices for augmenting revenues. Hundreds of thousands of persons who had never before directly felt the burden of government costs were drawn into the army of taxpayers. Efforts to avoid the impact of mounting levies resulted in a stream of litigation which poured through administrative tribunals and the courts in steadily increasing volume with rulings continuing heavily in favour of governmental agencies against the contentions of taxpayers.

Congress repeatedly altered and expanded the federal tax structure. The Revenue act of 1937 was aimed at closing loopholes for tax avoidance through personal holding companies, incorporation of yachts and country estates, creation of multiple trusts for relatives and dependents, husband-and-wife and parent-and-children partnerships, and wife in communityproperty states. The Revenue act of 1938 practically eliminated the un-

pension trusts and division of income between husband

distributed profits tax on corporations (enacted in 1936), revamped provisions relating to the capital gains and losses of corporations, gave limited recognition to the "last-in-first-out" method of inventory valuation and relaxed the penalties against personal holding companies.

In 1939 the federal revenue laws were consolidated into a code. The Public Salary Tax act of 1939 declared the salaries of officers and employees of states and their subdivisions to be income taxable by the federal government and permitted the states in turn to tax the salaries of federal officers and employees. In the same year the supreme court held that the salaries of federal judges were subject to income taxes (O'Malley v. Woodrough, 307 U.S. 277), overruling a 1920 decision. Other 1939 amendments relieved corporations from certain provisions which had been criticized as "business deterrents," extended temporary excise taxes and postal rates, prohibited sale of information obtained from tax returns and gave all taxpayers the privilege of using the "last-in-first-out" method of valuing inventories.

In 1940 the pressure of defense preparations was brought home to taxpayers with the broadening of taxes on individual incomes, the stiffening of surtax rates on middle income brackets, the imposition of a defense tax and excess profits taxes and other provisions designed to increase federal revenues. But this was only a foretaste of more drastic levies to follow. The defense and lend-lease program inaugurated an era of the heaviest taxation in U.S. history. The provisions of the 1941 revenue laws included the reduction of exemptions on individual incomes from \$2,000 to \$1,500 for married persons and heads of families and from \$800 to \$750 for single persons, the integration of the defense tax with the surtax, adoption of a simplified tax schedule for individuals with incomes of \$3,000 or less, the increase of excess profits tax rates and removal of the tax exemption feature on federal obligations issued after March 1, 1941. The 1942 Revenue act brought another sharp increase in income tax rates and a lowering of exemptions. Some previous inequities were adjusted by provisions making alimony deductible by the husband and taxable to the wife, introducing new carry-over provisions and granting relief from hardships imposed by war.

The pay-as-you-go system went into effect under the Current Tax Payment act of 1943, which provided for payment of income and victory taxes for the current year in quarterly instalments and required certain employers to withhold (on behalf of the government) 20% of wages and salaries in excess of exemptions to apply on the taxes of employees. To lighten the burden of changing over to a current basis, taxpayers were forgiven 75% of their 1942 or 1943 tax, whichever was smaller. An anti-windfall provision cut down the amount of forgiveness on large incomes resulting from war conditions. Special exemptions and allowances were given to members of the armed forces. Congress further revised its tax program with the passage, over the president's veto, of the Revenue act of 1943. which eliminated the individual earned-income credit, required certain exempt corporations to file information returns, increased the excess profits tax exemption and the rates, increased postal rates and certain excise taxes and made other changes.

In 1944 congress tried to simplify the problems of taxpayers in the less-than-\$5,000 income group by providing

short cuts for making returns, changing the amount and method of computing exemptions, rewriting the definition of dependents by eliminating the age limit and the head-of-the-family status, granting an optional standard deduction in lieu of all other deductions and changing the with-holding provisions. The victory tax was repealed, but the rates and incidence of the normal tax and surtax were rearranged to effect about the same impact on the majority of taxpayers as under the previous law.

With the passage of the Revenue act of 1945, congress granted the first tax cut in 16 years, to become effective in 1946. The excess profits tax was repealed. The \$500 income tax exemption for each individual, his spouse and each dependent, previously applicable only to the surtax, was extended to the normal tax. The surtax rate on all brackets was reduced by at least three percentage points. The normal tax and surtax were further reduced by 5%. The active service pay of the enlisted personnel of the armed services was exempted from income taxes, effective retroactively to all years beginning after Dec. 31, 1940, to the end of the war as proclaimed by the president. Preservice taxes on earned income for any "war year" were made payable over a three-year period. The capital stock tax and all excess profits taxes on corporations were repealed as of Jan. 1, 1946. The normal tax on corporation incomes was retained, but surtax rates were decreased from a range of 10%-16% to 6%-14%, depending on the size of net income. The previous freezing of social security taxes at 1% both for employees and employers was extended to the end of 1946. The \$5 auto use tax was repealed.

The federal government was not alone in its efforts to increase revenues. States and municipalities joined the chase to capture more of the taxpayers' dollars. Licensing fees and service charges for recreational facilities and public parking privileges multiplied. Some cities enacted income tax laws.

The courts passed upon innumerable technical phases of the complicated tax structure. In general, legal devices for the avoidance and reduction of taxes fared badly. The supreme court held that the entire corpus of trusts established by decedents while living were subject to the federal estate tax where the settlors had retained "strings" to the disposition of trust funds under certain contingences; closed the door on the use of a single premium life insurance and annuity contracts as a means of avoiding estate taxes where the insured retained a reversionary interest; blocked attempts to escape the federal gift tax through transfers of property by taxpayers to their intended wives in connection with antenuptial agreements; and barred family partnerships as a means for dividing income for tax purposes where the wife had not contributed substantially to the partnership in capital or services. Nor would the court countenance the attempt of the Oklahoma legislature to lessen the impact of federal income surtaxes on its citizens through the passage of an Oklahoma community property law. Such laws, adopted by a number of western states, provided for a division of family income between husband and wife for legal purposes, thereby giving citizens of such states an income tax advantage. The Oklahoma statute was defective because it was optional. It did not actually give the wife a legal claim to half of her husband's salary (Commissioner v. Harmon, 65 S. Ct. 103 [1944]). The court also upheld amendments of 1942 to the federal revenue laws subjecting the entire value of "community property," including the proceeds of insurance paid for by the decedent, to the federal estate tax (Fernandez v. Weiner, 66 S. Ct. 178 [1945]).

In its much-discussed 1943 ruling in the *Dobson* case (320 U.S. 489) and subsequent decisions, the supreme court held that it would not review tax court rulings unless it could identify a clear-cut mistake of law.

The high court also showed marked reluctance to interfere with state taxation. Imposition by states of income and excise taxes on out-of-state corporations, when based on business done within the taxing state, were approved by the court in a wide variety of cases. Sales and use taxes were similarly sustained, even though affecting interstate commerce, subject to certain finely drawn distinctions, depending on the wording and operation of the particular statute at issue. Interstate trade barriers were considerably strengthened by such decisions. The supreme court also affirmed the right of states to levy heavier taxes on foreign corporations doing business within their borders than on domestic corporations doing similar business. Multiple taxation of the same intangibles by different states was approved in a ruling "that there is no constitutional immunity from the taxation of intangibles in more than one state." The principle of intergovernmental tax immunity between federal and state governments showed signs of disintegration under the effects of supreme court buffeting. A new doctrine of permitting reciprocal nondiscriminatory taxation was announced. The court also upheld the special taxation of chain stores on the ground that it was not discriminatory in view of the type and scale of the business and its competitive advantages. (See TAXATION.)

Wages and Hours.—The fight of labour to establish a minimum standard of living resulted in the passage of the Fair Labor Standards act in 1938. It was designed to improve the lot of workers by means of a floor for wages and a ceiling for hours. The act, by its terms, applied to all employees "engaged in commerce or in the production of goods in commerce." It created a wage and hour division in the department of labour. The new law also provided for industrial committees to co-operate with the wage-hour division, and prohibited the transportation in interstate commerce of goods produced by oppressive child labour. Employers were required to pay one and one-half times regular wage rates for overtime work.

In two 1941 decisions, the supreme court upheld the wage-hour law as a proper delegation of legislative power under the commerce clause of the constitution (U.S. v. Darby, 312 U.S. 100); and Opp Mills v. Adm'r., 312 U.S. 126). In the Darby case the court approved the child labour provisions of the F.L.S.A., overruling its 1918 decision in Hammer v. Dagenhart, 247 U.S. 251, which had invalidated an earlier statute prohibiting the transportation in interstate commerce of goods produced by child labour. In another case the court said that the application of the F.L.S.A. to the newspaper business did not violate press freedom.

The supreme court approved a fairly liberal construction of the F.L.S.A. coverage. Application of the law depended upon the nature of the activity of the workers rather than upon the business of the employer. In determining whether a particular type of activity came within the act, the court applied the test of the "continuity of the flow of goods in interstate commerce." Among many other rulings, the court held that the act covered employees of a company operating a toll road used for the passage of goods in interstate commerce; labourers in a machinery repair shop which mainly serviced interstate commerce; employees in the central office of a chain grocery store, from which some goods were shipped to out-of-state stores; em-

ployees who handled intrastate deliveries of paper which was procured outside the state and a night watchman in a veneer plant whose output was shipped in interstate commerce, even though he did not take any physical part in producing or shipping veneer. In the latter case, the court stressed the fact that the primary purpose in employing the watchman was to get lower insurance rates. This and other circumstances showed that the watchman made "a valuable contribution to the continuous production of goods." His work had that "close and immediate tie with the process of production for commerce" which entitled him to the protection of the statute. This tie was held in 1944 to be close enough as to building service workers in the administrative office of an interstate milk distributor (Borden v. Borella, 325 U.S. 679). But in 1945 service workers employed by a New York office building comporation were held not subject to federal wage-hour control. The fact that more than one-third of the office space was used by concerns engaged in interstate commerce did not seriously involve them in the production of goods for such commerce. In 1946, however, the court found the F.L.S.A. applicable to employees engaged by a local company to wash the windows of buildings operated by concerns producing goods for interstate commerce.

Numerous decisions established the method of computing time and the basis of overtime for all types of employees: hourly, salaried, irregular or fluctuating, piece workers, home workers. The supreme court held that the time spent by miners of iron and coal while travelling underground between the portal of the mines and the "working face" was working time for which they had a right to be paid under the Fair Labor Standards act. Such travel was "work," since it was on the mining company's property, was under its control and used up the energy of the miners in the interest of their employer (Muscoda case, 321 U.S. 590; Jewell Ridge Coal case, 325 U.S. 161). Similarly, the court held in 1946 that time spent by employees of a Michigan pottery company in reaching their places of work on the employer's premises after punching time clocks must be classified as work for which they were entitled retroactively to overtime pay under the F.L.S.A. (Anderson v. Mt. Clemens Pottery Co., 14 LW 4434). This decision precipitated a nation-wide wave of "portal-toportal" wage suits which involved claims running into billions of dollars.

The supreme court also ruled in favour of employees of a soap manufacturing company who served as auxiliary firemen on the company's fire-fighting crew. The time they spent merely waiting for fire calls was working time for which they were entitled to pay on an overtime basis. Such fire duty was part of the production of goods in interstate commerce (Armour & Co. v. Wantock, 323 U.S. 126).

In a 5 to 4 decision, the supreme court found that employment of underage messenger boys by the Western Union Telegraph company did not violate the child labour provisions of the wage-hour law. While messages might be considered "goods," the defendant did not "produce" or "ship" them in interstate commerce (Western Union v. Lenroot, 323 U.S. 490).

The F.L.S.A. was reinforced by various types of wage-hour controls in all of the more important industrial states. The Washington state law requiring the payment of a minimum wage to women sufficient for their decent maintenance was sustained in 1937 by the U.S. supreme court in West Coast Hotel Co. v. Parrish, 300 U.S. 379, which overruled its 1923 ruling in Adkin v. Children's Hospital, 261 U.S. 525. (See WAGES AND HOURS.)

War Powers and Controls.—The lessons of World War I

were-taken to heart by war and navy department officials who prepared military and industrial mobilization plans for use in the event of another war. Authority to carry out such plans resided in congress and the president under the emergency and war powers conferred by the constitution, but it was obvious that the proper exercise of such powers would require implementation through new federal statutes. Existing war laws, such as the Espionage act and Trading with the Enemy act, both of 1917, were useful but far from adequate to support the contemplated program.

The first emergency law was the Neutrality act adopted in Nov. 1939, which confirmed President Roosevelt's earlier proclamation of U.S. neutrality and a limited national emergency made shortly after the outbreak of war in Europe. The act authorized the president by proclamation to declare when a state of war existed between foreign states, to define combat areas and to issue regulations with reference to foreign commerce. It forbade trade with belligerents, restricted the use of U.S. ports by armed vessels of foreign states, set up a National Munitions Control board and required the registration of arms makers, exporters and importers.

The success of the German, Italian and Japanese war machines in their aggressions against other nations made it clear that the United States should prepare to defend its own territory. Mobilization and training of manpower for military and naval purposes was therefore begun under the Selective Service and Training act of Sept. 16, 1940. On May 27, 1941, the president proclaimed an unlimited national emergency, declaring that the objective of the axis belligerents included the overthrow of democratic order and world-wide domination of peoples and economies. He called upon all citizens, workmen and employers to dedicate themselves to production for national defense. By act of Oct. 16, 1941, the president was authorized to requisition military or naval equipment, machinery, tools or materials needed to manufacture or operate such equipment for the defense of the United States upon payment of fair compensation.

On Dec. 8, 1941, war was declared against Japan, and on Dec. 11 against Germany and Italy. On Dec. 18, 1941, congress passed the First War Powers act, empowering the president to redistribute the functions of government agencies, except the general accounting office; to empower agencies to enter contracts and make payments in connection with the war effort; and to issue and enforce regulations freezing foreign credits and to exercise censorship over communications between the United States and foreign countries. The act included elaborate amendments of the Trading with the Enemy act, especially with reference to the powers and duties of the Alien Property Custodian. It was to remain in force "for six months after the termination of the war."

The Second War Powers act, adopted May 27, 1942, gave the Interstate Commerce commission emergency powers over motor and water carriers, authorized the requisitioning of property by the war and navy departments, established priorities for delivery of materials under war contracts and contained provisions for free postage for servicemen and other matters. The act was to remain in force until March 21, 1947. Its life was later extended to June 30, 1947.

The two war powers acts were supplemented by other statutes and innumerable executive orders and agency regulations. The nation was thereby democratically selfregimented for total war against the dictator-regimented

axis powers. Controls covered every phase of life, including manpower, production, distribution, foreign commerce, communications, transportation, finance, consumer credit, housing, food, fuel, rents, prices, wages, hours, scientific research and medical services. Various security regulations were enforced, including blackouts, the establishment of restricted areas and relocation of persons of Japanese descent. A civilian defense system was also set up.

This mobilization of economic and human forces affected every individual. The public in general accepted the resulting mass of regulations as a necessary part of prosecuting the war successfully. Businessmen took over the increased load of paper work imposed by war laws, including the renegotiation of their contracts with the government, with little complaint. The government adopted a policy suspending antitrust prosecutions as to war industries. Labour and management carried on under a voluntary no-strike-no-lock-out pledge.

The history of the creation of war agencies and shifting of their powers from one bureau to another was too complicated to report in detail. The general tendency was to carry on the war effort through new agencies rather than to assign emergency duties to existing government departments. Disputes frequently arose between agencies over their respective powers and functions since their duties and jurisdiction were not always clearly defined, either by statute or executive order. Most war agencies assumed such powers as expediency indicated were desirable in order to perform the work assigned to them; and for the most part these powers were not contested, and when contested, were generally sustained by the courts. (See also WAR AND DEFENSE AGENCIES.)

Foreign Trade.—The Trading with the Enemy act of 1917 (as amended in 1933, 1940 and 1941) became effective again at the outbreak of World War II. It provided the basis for the seizure of axis property and control of foreign trade. The Office of Alien Property Custodian was reestablished in March 1942 by executive order. The custodian exercised the powers conferred under the 1917 act and new supplementary legislation. All axis-owned business and property vested in the custodian. The treasury department exercised control over foreign exchange, transfers of credit and exports of currency, through freezing orders. Particular transactions were permitted by special licence. Trade was barred not only with axis nations but also with firms in Europe and Latin America known to be dummies for the axis powers.

Under pressure from the department of justice, certain U.S. corporations dropped directors and other officials who had represented axis interests through cartel systems. Similarly, cartel controls over patents, especially in the chemical and dye industries, were severed through consent decrees in antitrust suits.

Upon the outbreak of war usable axis vessels in U.S. harbours were requisitioned. In Jan. 1942 the operation of all vessels in foreign trade was assigned to the new War Shipping administration; and in April of the same year all shipping was requisitioned for war purposes. Authority for government operation of the merchant marine was derived from the First War Powers act and previous laws.

Radio, telephone and telegraph came under rigid control, and strict censorship was established over all communications with points outside the United States.

Manpower.—On April 18, 1942, the president established the War Manpower commission in the Office for Emergency Management. The chairman of the new agency was directed to formulate a program for the most effective mobilization and maximum utilization of the nation's manpower; to review the requirements for military, agricultural and civilian manpower; and to allocate available manpower in accordance with relative needs. Certain agencies, including the Selective Service system, were ordered by the president to conform to the directives of the WMC as to the classification and use of manpower. The U.S. Employment Service and other agencies dealing with employment were transferred to the WMC. Subsequent executive orders required the war and navy departments to determine the number of men needed each month under the draft and made the employment or retention of employees in war production subject to WMC regulations. The WMC was thus vested with power almost equivalent to conscription of labour, since it was enabled to freeze employees in war plants to their jobs.

In carrying out its work, the WMC devised a "manning table," which listed the types of workers engaged in essential war production activities who should be granted deferment under the Selective Service system and provided a basis for the withdrawal of such workers as were capable of military and naval duty at a rate that would permit others not qualified for such duty to be trained to replace those withdrawn.

The WMC was terminated Sept. 19, 1945. (Also see section Labour Relations, above.)

Price, Rent and Wage Control.-Vigorous efforts were made to avoid the inflationary spirals of World War I. The Office of Price Administration was created by executive order as part of the defense program on April 18, 1941, but it did not receive statutory support until the passage on Jan. 30, 1942, of the Emergency Price Control act, which gave the price administrator power to establish such price ceilings as he deemed proper to prevent unwarranted price rises, except that maximum prices on agricultural products could not be fixed below the highest level determined by certain bases—one being 11000 of parity with industrial prices. Agricultural price ceilings were sub ject to the approval of the secretary of agriculture. The authority of the price administrator was backed by provisions (1) that wilful price violations would be criminal offenses, (2) that the administrator might obtain injunctions against violations, (3) that persons charged with violation would be subject to suit for triple damages and (4) that the administrator might license persons to sell products subject to maximum prices and if there were violations he might bring suit to suspend such licences. The administrator was also given the right to investigate and to issue subpoenas.

On April 28, 1942, the price administrator issued a general maximum price regulation as part of a seven-point anti-inflation program announced by the president. This regulation, which came to be known as "General Max," was a blanket freeze order on the prices of all commodities. It provided two kinds of controls: (1) that each seller of each product must abide by the prices he received at a fixed date in the past and (2) that definite price ceilings must be adhered to on all sales of particular products by whomever they were sold.

The price control act created an emergency court of appeals to review OPA orders and provided that such review could be had only in that court and the supreme court. The latter court ruled that this limitation properly excluded other federal courts from reviewing price orders (Lockerty v. U.S., 319 U.S. 182 [1943]). The high court also upheld the delegation by congress to the OPA of broad authority to fix prices and rents, since adequate

standards for determining the occasions for the exercise of such authority had been laid down (Yakus v. U.S., 321 U.S. 414 [1944]; Bowles v. Willingham, 321 U.S. 503). The administrator's power to suspend dealers guilty of black market operations and cut them off from further supplies of commodities was also sustained by the court (Steuart & Bro. v. Bowles, 322 U.S. 398 [1944]). But the price administrator did not have an absolute right to the issuance of an injunction restraining future violations of price ceilings, because that remedy rested within the sole discretion of the court (Hecht Co. v. Bowles, 321 U.S. 321).

The price control act was amended in 1943 by provisions requiring personnel to have business experience and limiting OPA power in setting standards and imposing grade labelling. The act, as amended and extended, expired on June 30, 1946. The first proposal of congress to extend controls was vetoed by the president, but on July 29, 1946, he signed a redrafted extension measure which continued rent controls and the power to control prices until June 30, 1947, with provisions for decontrolling prices as rapidly as possible. By the end of 1946, all price ceilings were lifted except on sugar and rice.

Wage controls were also instituted by the federal government as part of its general policy of checking war inflation. The Wage and Salary Stabilization act adopted on Oct. 2, 1942, as an amendment to the price control law, directed the president to order the stabilization of prices, wages and salaries affecting the cost of living at the Sept. 15, 1942, level, as far as practicable. It provided that no employer should pay and no employee receive wages or salaries in contravention of the regulations laid down by the president. The day after the passage of this act the president by order created the Office of Economic Stabilization in the Office of Emergency Management to formulate a national economic policy relating to control of civilian purchasing power, prices, rents, wages, salaries, profits, rationing, subsidies and relative matters to prevent avoidable increase in the cost of living.

Under executive orders and OES regulations the administration and enforcement of the wage stabilization program was assigned to the NWLB and the Salary Stabilization unit of the bureau of internal revenue, except as to agricultural labour, which was left to the war food administrator, and railway labour, which was governed by the National Railway Labor panel. Authority to grant increases was limited to those necessary to correct inequalities and gross inequities, eliminate substandards of living and aid in prosecution of the war.

On April 8, 1943, President Roosevelt issued his "hold-the-line" order, forbidding wage increases except such as were necessary to correct substandards of living and those allowable under the "Little Steel formula" which had been applied by the NWLB. This formula provided for increases up to 15% above wages paid on Jan. 1, 1941, which was the estimated rise in the cost of living between that date and May 1, 1942.

Limitations on wage and salary increases were substantially relaxed by executive order on Aug. 15, 1945, and on Sept. 20, 1945, the OES was terminated and its work was turned over to the stabilization administrator in the Office of War Mobilization and Reconversion. On Dec. 31, 1945, the president created the National Wage Stabilization board in the department of labour and transferred to it the wage stabilization functions of the NWLB; and on Feb. 21, 1946, the OES was re-established. This chapter was closed, however, on Nov. 9, 1946, when all wage and salary controls were lifted.

Priorities, Allocations and Rationing.—The production

of guns, planes, tanks, ships and other war munitions necessarily curtailed production for civilian use. War needs had to be filled first, and even in civilian production preference had to be given to the more urgent needs of everyday living. The first step was taken when the president in Dec. 1941 delegated to the newly created Office of Production Management the authority to requisition war materials. Shortly thereafter, the job of requisitioning and determining priorities and allocations was assigned to the War Production board established in the Office for Emergency Management. The WPB was also directed to determine policies and procedures in respect to war procurement and production.

The WPB administered priorities and allocations under the "controlled materials plan" which aimed at assuring a balance between supply and demand in such a way as to make materials available to consumers in the quantity and form and at the time and place required to meet authorized programs and schedules. The plan provided for the division of available controlled materials among the various claimant agencies in the interests of the most efficient use of the materials in war production, as well as the further division of such supplies between primary and secondary consumers. Newspapers and magazines were cut in their consumption of print paper, processed foods were placed under rationing at consumer levels and inventories of consumer goods in the hands of large retailers and wholesalers were curtailed. Each request for available materials had to be weighed carefully against the needs of the war program. Simplification and standardization of innumerable commodities and elimination of many others released millions of tons of critical materials for military use.

Rationing of consumers' goods was assigned by the WPB to the OPA, and the civilian rationing of food was also assigned to the same agency by the secretary of agriculture, who had been given full authority over the nation's food program. Certain commodities, such as automobiles, typewriters and rubber, were frozen. (See Prices; Rationing.)

Public Contracts.—The negotiation and renegotiation of contracts for the production of war materials became a major government activity. The general policy of paying on a cost-plus-fixed-fee basis was established during defense preparations under laws relating to naval, army and marine construction. The two war powers acts empowered the president to authorize any government agency engaged in war work to enter contracts and make payments relating thereto, and contained various regulatory provisions. War contracts in general contained strict penalties for delays but also assisted contractors through provisions for progress payments and advances. The government further undertook to indemnify contractors against suits for patent infringements in order to avoid delays which might be caused through doubts as to conflicting patent claims.

Control of profits was instituted through the renegotiation process in the hope of preventing the recurrence of excessive war profits taken under cover of law during World War I. Under the Renegotiation act of 1942, as amended, government departments were directed to insert in all war production contracts involving amounts of more than \$100,000 provisions for renegotiation of the contract price with contractors and subcontractors for the purpose of eliminating excess profits. Government agencies were authorized to withhold any part of the contract price found through renegotiation to have been excessive and to recover such amount if already paid. A policy was adopted of allowing a greater profit margin to contractors who

succeeded in lowering the cost of war goods through greater production efficiency.

Discretion was vested in the army, navy and maritime commission under the First War Powers act to disregard prior laws concerning government contracts, except such laws as the Walsh-Healy and Davis-Bacon acts, containing minimum wages, maximum hours, health and safety provisions and banning child labour, which remained in full force. The requirement that clauses against racial discrimination in employment practices be written into government contracts was announced as mandatory, but no provision was made for enforcement.

The Contract Settlement act of 1944 provided for the speedy and equitable settlement of all claims arising from termination of war contracts by the government; and the War Contract Hardship act of 1946 authorized further relief from losses for supplies or services furnished to the government under war contracts. The Anti-Kickback act of 1946 extended the provisions of a similar 1934 law by prohibiting the practice of subcontractors of paying fees or kickbacks or making gifts to employees of "cost-plus" primary contractors. (See also War Production.)

Selective Service and Veterans.—Every male resident of the United States between the ages of 18 and 65 years was required to register under the Selective Training and Service act of 1940. Those between 18 and 45 years of age were made liable for training and service in the land or naval forces. The act specified the method for selecting men and the order of their induction, provided exemptions for ordained ministers of religion, gave the president power to make rules deferring certain groups with dependents and contained provisions for the re-employment of veterans after their discharge. This basic draft law was amended from time to time by enactments extending its operation, changing provisions relating to age limits, exemptions, deferments and re-employment, and granting pay increases. It was also amplified by numerous rules and regulations.

On Oct. 17, 1940, congress passed the Soldiers' and Sailors' Civil Relief act, suspending the enforcement of civil liabilities against members of the armed forces. This act and its amendments contained various moratory provisions granting servicemen relief against court actions and against rent, instalment contract, mortgage and other financial obligations. It also provided for the issuance of government life insurance to persons in service.

The re-employment provisions of the Selective Service law and collateral enactments guaranteed to every veteran of the armed services and merchant marine the restoration of his former job or a job of like seniority status and pay, provided that his old job was not temporary, that he received a satisfactory discharge certificate, that he was still qualified for the job, that he applied for his old job within go days after discharge (or 40 days in case of veterans of the merchant marine) and that the employer's circumstances had not changed so as to make it impossible or unreasonable to reinstate the applicant to the same or a similar position. Re-employed veterans were also assured the restoration of all insurance and other benefits pertaining to their jobs when they entered service. Discharge of a re-employed veteran without cause within one year of his reinstatement was forbidden.

Administration of the provisions relating to re-employment of veterans was turned over to the director of selective service, who issued a handbook on the subject, advocating the view that a veteran had an absolute right to his old job or one of like seniority, status and pay, even

though this might displace an employee with greater seniority who had not seen war service. This superseniority doctrine was rejected, however, by the supreme count (Fishgold v. Sullivan D. & R. Corp., 66 S. Ct. 1105 [1946]).

Anticipating the war's end, congress in 1944 enacted the Servicemen's Readjustment act, popularly called the G.I. Bill of Rights. It declared the Veterans administration to be an essential war agency, entitled, second only to the war and navy departments, to priorities in personnel, equipment and material; authorized the administrator of veterans' affairs and the Federal Board of Hospitalization to expedite and complete additional hospital facilities for war veterans and to establish regional and branch offices; and appropriated \$500,000,000 for hospital facilities. The act provided protection for all veterans in filing claims for compensation, pensions and hospitalization and educational subsidies, subject to certain limitations, for those whose education or training was delayed or interrupted by entrance into service. The act further provided loans for the purchase or construction of homes, farms and business property; created a Veterans' Placement Service board to co-operate with the U.S. Employment Service; and provided readjustment allowances for former members of the armed forces who were unemployed. (See SELECTIVE SERV-ICE; VETERANS' ADMINISTRATION.)

Further legislation in 1945 and 1946 liberalized provisions for medical care and education, and loans to veterans; established a department of medicine and surgery in the Veterans' administration; granted terminal leave pay in the form of U.S. bonds to be issued to enlisted personnel to make up for lost furlough time; made other pay readjustments; and appropriated \$30,000,000 to provide specially equipped motor cars for disabled veterans.

BIBLIOGRAPHY.—For federal statutes see: U.S. Code (Government Printing Office); U.S. Code Annotated (West Publishing Co.); or Federal Code Annotated. For rules and regulations of all federal agencies see the Code of Federal Regulations (Government Printing Office). Federal executive orders and agency rules and regulations are published in the Federal Register (Government Printing Office). For state statutes, see the codes, session laws and annotated statutes of the several states. A State Law Index is published biennially by the government printing office.

The General Digest, published by West Publishing Co., provides a guide to court decisions, state and federal, embraced in the volumes of the National Reporter system. For U.S. supreme court decisions see: U.S. Reports (Government Printing Office); U.S. Sup. Ct. Reports, law. ed. (Lawyers Cooperative Publishing Co); or Supreme Court Reporter (West Publishing Co.). State court decisions are also published in a separate series for each state.

Europe

A variety of causes combined to make the years 1937–46 a period of great change and unparalleled development in law in Europe. First, the direct results of six years of world war on European legal systems and on the principles on which those systems were based, were no less remarkable than on other departments of life in which the ordinary citizen was vitally interested. Science, construction of every

means of transport, dietetics, medicine and surgery all profited, as always, by a speeding up of development when a major war was being fought, but this time law was not less affected. In law indeed the changes appeared even more remarkable and the development even greater when contrasted with legal developments over any period of similar length. War demanded greater development in laws to regulate life; the urgency with which improvements were devised in other spheres might have been equal, but in law it was more noticeable since regulation was never before so widely, so fundamentally and for so long a time necessary for the prosecution of the war. Law had to be brought up to date with a speed and an urgency hitherto associated only with wartime advances in medicine and science.

A second and scarcely less remarkable course of legal development in Europe was the particular state of social consciousness and the stage of political and civic advancement at the beginning of World War II. Before World War I there had been in only a few countries any radical signs of change in the social and political construction of European states; but in 1937 the huge soviet experiment was well on its way, Great Britain had had two Socialist governments, the Scandinavian countries had become established Socialist democracies, France was in a state of torment and weak vacillation as a result of multiparty govvelopments in the period 1937-46 would be more widely political systems later to end in disaster. The widespread political awareness, the higher educational standard and the better living conditions of the working man in every country and the increased ease of international communications of all types, provided a unique background for a war with its consequent developments, and a background in which for the first time law and laws were the concern of every individual. The growth of democracy throughout Europe between 1918 and 1937 made it certain that any developments in the period 1937-46 would be more widely felt and discussed by, and would more directly interest and concern, the individual man or woman in every land; but particularly was this true of legal developments, since law was the means of holding the balance between the rights of the individual and the requirements of his state, and since legal remedies and relief had become so much more widely available to all classes than ever before.

There were many minor causes for legal developments. A few examples were: the increase in the availability of wireless (radio) sets, in the literacy of European nations and in the circulation of newspapers, by all of which means easier publication and explanation of legal changes and their effects and speedier enforcement of new laws and punishments for their infringement were possible; the growth of humanitarian feeling with the consequent demands of public opinion in all countries for better treatment for the underdog and for means whereby the poorer could secure equal treatment with the rich; and the fact that totalitarianism in fascist countries necessitated great centralization of power in other countries at war with them and so forced into existence a temporary form of nationalization in many cases which easily could, and often was, converted after the end of the war into more permanent forms of central control of all important national assets.

Thus, there were ideal conditions in Europe between 1937 and 1946 for important fundamental and widespread legal developments. Developments in different countries varied in accordance with the individual changes of conditions, but there were remarkably clear divisions of Europe into groups of countries which developed legally along the same lines. The grouping depended on the effect on

each country of the war and in particular on the extent to which the country took part, the extent to which each country was invaded or threatened with invasion, and the extent to which the continuity of legal system of each country was broken by foreign domination or occupation.

Least affected were the group of neutrals, Portugal, Spain, Sweden, Switzerland and Turkey. The national as opposed to international developments were few in the neutral group of countries; they were confined to nationally protective measures designed strictly to enforce the central control of vital national resources and to ensure that the best use in the interests of the nation was made of export and import, trade facilities and currency. In Turkey, for example, an import regulation code came into force, together with an import licensing system. These countries, cut off from the war, none originally members of the United Nations organization and none subject to any swing of political opinion to the left, were not affected by the main causes underlying legal developments between 1937 and 1946, except solely insofar as they had to take steps for their own protection in currency and trade.

Another group comprised those countries which were invaded and occupied but afterward freed, such as Belgium, Czechoslovakia, Denmark, France, Greece, the Netherlands, Norway, Poland and Yugoslavia. Many of these countries aided continuity of legal systems by maintaining or forming an émigré government.

A third group was composed of the countries on the losing side in the war, which were invaded and occupied but most of which had at least begun to be freed by 1946 (Austria, Bulgaria, Germany, Hungary, Italy and Rumania).

The remaining group consisted of Great Britain and the U.S.S.R., both of which were threatened with, and fully prepared for, an invasion of their own soil extending to their capital cities, and both of which lost and later regained control of part of their territory: in the case of the former only the comparatively insignificant Channel Islands were lost, and in the case of the latter a vast stretch of territory, but these losses had the same effect on laws and legislation in that an unsuccessful threat was made to the security of the capital cities; steps for evacuation of the central government were taken and vast national efforts at self-defense called forth.

Supranational Developments.—While changes were taking place inside European countries, other important developments were occurring in the international sphere of law which concerned all countries. These were of a supranational rather than international character and were steps on the way toward the setting up of a central sovereign authority with powers over all the states which were members of the authority and which, by voluntary surrender of a part of their sovereignty, would give supranational sovereignty and effectiveness to the central authority. There were two developments of this nature: the establishment of the United Nations with a legal department, the International Court of Justice; and the setting up of an international criminal tribunal for war crimes which first sat at Nuernberg.

The International Court of Justice (q.v.) was established at The Hague where it took the place, made vacant for it, of the Permanent Court of International Justice. The latter, which drew its authority from the obsolete League of Nations, was closed down. The differences between the two were not startling; there was no break in the continuity of principles and system between the two courts.

The International Court of Justice was established to decide legal questions under the United Nations, but questions which were not essentially legal were to be referred to the Security council, which suffered from the difficulty that any one of the four permanent members could impose a veto on any resolution and so nullify a decision in advance. The division of questions into "legal" and "political" was generally felt to be a false and obstructive one, since any nation which wished to refer a question of vital international importance could, in effect, by claiming that the question was really "political," avoid the International Court of Justice altogether and take the question into the sphere of decision of the Security council, where one major friendly power could, by the veto, at any rate prevent any decision unfavourable to itself or its friends. If the Court of Justice was to function in international cases of any great importance it was necessary to establish it as a court of justice, not as a court of law.

In internal courts in any country, law as administered necessarily fell far short of justice as it ideally should be for two reasons: first, the time and expense which would have to be incurred to make and administer laws sufficiently detailed to give exact justice to all made it impossible to do more than secure fair treatment to all, not perfect treatment; and second, there was always the superior interest of the state to be considered and it might (often rightly) sway the court away from giving the fullest protection to the individual. These considerations did not apply to an international court of justice. To decide any question of importance the expense was great and to decide it with the greatest care and exactitude cost an inconsiderable amount more; the interest, too, corresponding to the interest of the state pulling against the individual, was the interest of the whole world, of humanity-in fact, it was absolute justice.

A Court of Justice, therefore, to which all questions of dispute among nations could be referred, freed from the strangling power of the veto, and deciding all questions on the basis of pure justice (and not of law) was required but was not produced by the United Nations. There were signs at the end of 1946 that the power of the court might be more widely based in the future but, as it actually was in 1946, the International Court of Justice was unable to deal with important international questions which had been put outside its jurisdiction, and so could only continue to render service to the world in a number of cases of lesser importance, just like its predecessor.

A far greater development was the setting up of the International War Crimes tribunal which first sat at Nuernberg. This was the first attempt to establish an international court for criminal cases (in which the person found guilty might be punished by death or imprisonment) as opposed to civil cases (in which the adjustment of rights between two parties is effected). Criminal cases previously had been tried in some country according to the law of that country, and a criminal who escaped from the jurisdiction of one country might or might not find himself tried for his crime in a second country, in accordance entirely with the laws of the latter. The waging of aggressive war first appeared as a crime recognized by law when this court was established; a further innovation was the fact that organizations, such as the German schutzstaffeln (the S.S.), could be found guilty as well as individuals. A curious result of this innovation was that a member of any guilty organization was prima facie guilty himself. This extension was not welcomed, for it appeared to many not in accordance with the highest standards of justice, but the idea had many parallels in countries of Europe at the time and was more apparently than actually unjust, if indeed it was unjust at all. The tribunal did not, however, deal only with the crime of waging aggressive war; it also dealt with other crimes, such as murder and breach of the internationally recognized code of warfare known as the Geneva and Hague conventions. Its jurisdiction was therefore to try individuals and organizations accused of all types of ordinary noninternational crimes (such as murder), of breaches of the rules of international warfare as recognized in 1939, and of the new crime. Its jurisdiction was exceptional only insofar as the new crime was concerned and in the trial of organizations in addition to individuals.

The sanctions behind the tribunal were the armed might of the victors in World War II. The judges were taken from France, Great Britain, the U.S.S.R. and the U.S.A. The president, Lord Justice Geoffrey Lawrence of England (ably assisted by the great English criminal lawyer and judge, Sir Norman Birkett), had a difficult task. The number of languages used and the length of the cases were minor difficulties compared with those of initiating a form of procedure acceptable to the four great nations and not incompatible with justice. In France a prisoner was at this time presumed guilty until he was proved otherwise; in Great Britain the reverse was true; in the U.S.A. much more demonstrative appeals by the prosecution were allowed; and in the U.S.S.R. it was the practice to prosecute only when a conviction seemed certain and usually for the prisoner, after long examination out of court, to confess at his trial. This was the first attempt at an amalgamation of these differing ideas of criminal justice and so caused much unfavourable comment in nearly all European countries. Since the practice and procedure was a compromise between those of four nations it was bound in some ways to differ from, and fall short of, the accepted principles of criminal justice in each, and it was on these divergences from national practices that a number of criticisms were based. Such criticisms were ill-founded and ignored the fact that any practice and procedure which wholly met the approval of any one national group of critics would by doing so depart even further from the practice and procedure acceptable to critics of other national groups. Other objections on the ground that the crime of waging war was invented after the criminals tried had committed it ignored the fact that before 1938 this crime was recognized by all fair-minded individuals throughout Europe and must have been recognized by the criminals themselves in 1939; an objection of this nature was therefore one which went to form only, not to substance or justice. Trials of all the major war criminals took place; and some were condemned to death, some to terms of imprisonment. The tribunal was an important and successful development of criminal law and the first application of international criminal law in Europe. (See WAR CRIMES.)

Occupied Countries.—The countries which were invaded in World War II naturally had many difficulties to overcome at the end of the war when the prewar government or its successor took back power from the foreign occupier. Collaborators had to be dealt with, a mass of imposed legislation sorted (some retained and the remainder of it abolished), new constitutions established and industrial law revised in the light of less fortunate economic circumstances and less material wealth. Some countries had evacuated their governments intact to England and were able thereby to maintain a useful continuity. Governments such as those of Norway, Czechoslovakia and the Netherlands in their temporary abodes in London were able to enact much

temporary law to deal with their own forces, their own merchant seamen and others of their nationals who were aiding the national efforts at survival from outside their homeland. Such legislation dealt with military matters and with the provision of temporary aids to citizens in their domestic affairs. Norway, for example, extended the laws of divorce so that persons in England might divorce wives or husbands in Norway even if the latter were ignorant that a divorce was being sought. Such legislation was transient, and its extensions were repealed on the return to normal conditions in 1945. Laws which dealt with the lorces of such countries differed in no way from what such laws would have been in the home countries had these not been invaded, except that the recognition by a proper power of the right of such émigré governments to legislate while on foreign soil and dispossessed of their whole country was an innovation and a break with international legal precedents. It was at once a recognition of the gravity of World War II and a step toward the acceptance of the interests of such countries as existing in, and vitally affecting, other countries with whom there had before been no mutual legal tie.

Countries on the other hand which were unable or unwilling to establish or support émigré governments maintained in some cases, as in Denmark and Yugoslavia, considerable powerful elements acting either through the occupation forces by skilful and intelligent twisting of the law (as in Denmark), or through powerful, fast-moving and well-organized guerrilla forces with a central and recognized controlling organization (as in Yugoslavia). In these cases, too, continuity was less broken, and it was not difficult to rebuild a legal system in the homeland since it existed in a part of the world throughout the war. Greece and Poland were unable to maintain continuity, since in the former case no centrally recognized authority continued in existence, and in the latter the authority which hoped to resume government was discredited and unable to return to its own country in 1945.

Where there was no continuity, extensive electoral and constitutional laws became necessary in 1945; to take an extreme example, France had, by the end of 1946, settled little more than the electoral laws and the form of its new constitution; all laws, other than necessary day-to-day legislation, had to wait for decisions on the constitution and for the establishment of a government which could remain in power for more than six months. At the other extreme of such states as did not maintain continuity of legal system were the Polish, Czechoslovak and Yugoslav republics. These attached less importance to constitutional laws and more to economic ones; this was partly due to proximity to the U.S.S.R. and partly to the far greater chaos of disorganization of material resources in which these states were left at the end of the war. The struggle for existence ended on the military plane but continued on the economic.

Czechoslovakia embarked on nationalization in 1945 of most of the major industries, including mines, power and public utilities and the iron, steel and metal, armaments, explosives, chemical, paper, sawing, cellulose, food, banking and insurance industries. Glassworks and brickworks were nationalized if they employed more than 150 persons. Compensation was payable but not to Germans or unpatriotic persons, such as the "unreliable persons" mentioned in an earlier law of the same year. These included Germans and Magyars and, besides being ineligible for compensation for nationalized industries, they were forbidden by a law of 1946 to be in any position of importance in any of the industries which were taken over by the state. In Oct. 1946 a law was made by which increment

duty was payable on increases in value between Jan. 1, 1939, and Nov. 15, 1945. A declaration was required within 60 days and duty charged on a sliding scale up to 100% on amounts of more than \$9,300. At the same time a capital levy on all values at Nov. 15, 1945, was made. The rate depended on the taxpayer's age, and a personal allowance of a tax-free element was deducted in respect of each member of the taxpayer's family before assessment; there was again a sliding scale with a maximum rate of 30% on taxable amounts of \$400,000 and over. The previous capital levy law of 1942 was cancelled, but capital levy tax was chargeable in addition to increment duty, and no payment under either head diminished liability in respect of the other tax. Strict penalties were used to enforce these laws.

Yugoslav postwar legislation was not dissimilar and also began in 1945. There were laws for the return of property abandoned through war causes to its original rightful owner, for state property management of such property on a trusteeship basis and for the cancellation of the duty to return if nonreturn was deemed in the interests of the state; in the latter case the trusteeship became protection of actual state property for the benefit not of the owner who had formerly abandoned it, but solely of the state. There was also an agrarian law, by which no person could retain more than a maximum amount (which was ascertainable but not the same in all cases and varied between 50 and 90 ac.) if the land was being exploited by leasing it or by use on it of hired labour. Land was allocated to poor farmers, a fund was established for orphans and collective children's farms were set up. Neither indemnity nor compensation was payable under this law. Valorization of securities was decreed in the same year. In 1946 shares were subjected to further restrictions: all had to be registered in Yugoslavia or with a Yugoslav consulate abroad. No bearer shares might be issued, and no transfers were legal without government permission. There were also decrees confiscating war profits made by war profiteering with severe penalties for failing to give up such profits. In July 1946 a number of industries were scheduled for nationalization, including the coal, gasoline, mining, electricity, metal, chemical, textile, leather, shoes, glass, paper, cement, sugar, oil and agricultural seed industries; later in 1946 a decree enacted state control of most important types of property for three years (including all the nationalized industries) and laid down that neither nationalized property nor any other temporarily taken over by the state should be returned to its original owners if such return were detrimental to the interests of the state. As nearly all foreign property was necessarily under state control, the latter decree provided a means of expropriating foreign interests where required.

In Poland no legislation of importance began before 1946, during which year a sweeping and complete code of nationalization was decreed and enforced. All industries capable of employing more than 50 individuals in one shift were scheduled for nationalization except builders and building contractors and industries already owned by municipalities or co-operative unions. It was not necessary that all such industrial concerns be nationalized, but all were scheduled by the appropriate local authority. In due course the case of each industrial undertaking came before a commission, which decided whether that particular undertaking should belong to the state, a municipality, a co-operative union or an individual or group of individuals. There was a right of appeal to a higher control commission, and the right of individuals to begin or con-

tinue a private enterprise was expressly recognized if the appropriate local authority had approved of such an individual enterprise beginning or continuing. Full regulations for procedure were laid down, and all decisions under the law had to be taken by the end of 1946. Laws provided for the procedure of taking over by the state and for state supervision of all scheduled undertakings pending a decision as to whether each was to become a state enterprise or not. Compensation was payable for undertakings taken over, and its amount was assessed by a special commission appointed for that sole purpose; compensation was not, however, payable to Germans or to persons classed as Germans. For this purpose persecuted persons were classed as Polish, whatever their actual nationality had been, and those who were Polish but had escaped or tried to escape to German-controlled areas of Poland were classed as Germans. As a general guide, certain industries were declared suitable only for public ownership unless very special circumstances existed; these included the mining, gasoline, electricity, gas, water, iron and metal, coke, armament, aviation, explosives, printing and transport industries, tele-communication and larger textile undertakings. Sugar concerns, distilleries, large breweries, large cornmills, oil mills, cold storage plant and yeast undertakings were declared normally suitable for local ownership by municipalities or co-operative unions.

The great destruction of buildings in Poland produced a demolition and repair law of 1946 by which any material removed by the state in the process of demolition and repair became state property and was taken over without compensation. The state might repair any buildings on which repairs had not been started and then retain ownership of them for up to ten years; during this time the person who would otherwise have been the owner was entitled to possession but had to pay to the state a rent based on the cost of repairs plus interest, but subject to a maximum. At the end of ten years the tenant regained ownership and ceased to pay rent, even if he had not by then repaid the state in full. There was also a sequestration law in 1946 by which all property abandoned and not in the true owner's possession was taken over to be managed by the state as trustee; the rightful owner was entitled to reclaim his property so long as he did so within periods varying from 5 to 20 years (for different types of property), after which time the state retained any unclaimed property. Any property of German or Gdansk individuals became state property under this law, and any purchaser of property which had been held by German or Gdansk persons was unable to claim to retain such property even if he did not know that it had once been German-owned.

The similarity between the Czechoslovak, Yugoslav and Polish nationalization laws was remarkable. They were all influenced to a great extent by Russian legal developments and were based more on the theory that law was a system of regulation by the state of state property in the state's interest, than by the view of law as a state-paid but aloof service or system holding the balance fairly between opposing interests which were generally private citizens but one of which was sometimes a state department.

In Greece, two important legal developments were also connected with foreigners. A law providing for state control of concessions involving public utility works and services took control from foreign interests; and a later law, in 1946, provided severe penalties for unlawful possession of, or dealing in, articles belonging to the Allied forces.

The latter was aimed at the prevention of brigandage which too wide a distribution of arms had facilitated.

Norway, after the return of its government to the home country, restored a system differing little from that of 1936 except that coastal shipping was nationalized (and so brought into line with other transport services), strenuous punishments for collaborators were enacted and merchant seamen were put on a par with naval personnel for service pensions and pensions for dependents of those killed in action. A remarkable feature was the nationwide response to an appeal for voluntary funds for such pensions to supplement the already large state allocation. Conditions of service for all mercantile mariners for the future were also greatly improved by the introduction of an employment code for them. Temporary legislation made in England was largely cancelled, as was most of the German-imposed legislation made during the German occupation of Norway; some German laws, however, which had been found of use were retained in force.

In the Netherlands, after the return of the government, it was found necessary to restrict by law the maximum spending of all individuals to the amount of their earnings; this law was, however, administered with due regard to individual circumstances, and sufficient exceptions were in practice allowed to prevent any hardship:

The legislative developments of this group, were, therefore, primarily directed at the re-establishment of national economy and a reconstruction of the material wealth. The central and the more eastern nations paid more attention to economic reconstruction; France, however, directed its first efforts to constitutional reconstruction before proceeding to a thorough attempt at planned economic rehabilitation.

Germany and Italy.—Germany and Italy up to and during World War II were subjected to great alterations of the effects of their laws with comparatively few innovations in the form of laws existing previously.

In Germany, particularly, although new courts were set up, forms were usually retained, but the persons administering the law were subjected in various ways to political pressure, and the law was perverted for the political purposes of the National Socialist state. The secret police were given powers of arrest (based on protective custody), as a result of which their prisoners were put outside the jurisdiction of the criminal law, and unofficial party courts were usually able to keep differences between members out of the national courts and to settle them privately. Trade organizations were able, under clauses in employment contracts, to insist on the reference of nearly all matters affecting their members to arbitration.

In these ways, many cases were kept out of the courts and decided, in effect, by persons acceptable to the ruling party in accordance with state policy. But other means were often widely adopted to influence decisions of courts so that these coincided with what was required by the highest members of the party ruling the country; such were the inculcation of political doctrine at all stages of legal education, the putting of the control of legal education into the hands of trusted party men, the introduction of extraneous qualifications unconnected with law into the course required to be passed before practising as a lawyer (such as attendance at, and passing, a physical training course), and finally the award of all worth-while appointments and promotions to persons acceptable to the party rather than to those most suitable from a legal or judicial point of view; the latter form of influence was particularly effective, since the career of a judge relied much more on state approbation in the German system, in which a lawyer started as a judge at an early age and depended for success on promotion, than in the British system, in which higher judicial appointments were often made from successful barristers rather than from judges of inferior courts.

Litigation between private persons was discouraged as far as possible or kept out of the courts, unless it was litigation by the poorer persons which was state-aided and so naturally distributed to politically acceptable lawyers in preference to others. It thus became increasingly difficult for a lawyer to earn a livelihood unless he was prepared to fall in with party requirements. In spite of this, there were some who persisted in refusing to allow party considerations to interfere with justice, and these formed a valuable postwar nucleus for reconstruction. The law itself (except for the addition of special courts connected with the party which were abolished) was not so much perverted as were the personnel, and a removal of politicallyminded lawyers after the war (included in the removal of National Socialist supporters of all professions) left the law in a satisfactory state to carry on. The division of Germany in 1945 into four zones of occupation under different powers considerably delayed postwar return to legal normality by withholding national sovereignty. A feature of postwar Germany was the exceedingly high number of divorces which reflected the general unhappiness in that country in 1945 and 1946.

Italy was in a position similar to that of Germany, but gained by its earlier defeat and consequently earlier recovery of national sovereignty and beginning of national reconstruction.

Great Britain.-Much legislation was enacted by parliament, but there was also a large volume of detailed legislation effected by the method of publishing rules and regulations under various acts, which were authorized by parliament exactly as if they had been in the acts under which they were published, at the time of the enactment. This method of legislation had been used occasionally before 1936 but not frequently; in 1939 and later years, however, it became a regular practice, first under the pressing needs of the war, and later under the equally pressing need of the Socialist majority in the British parliament to convert the constitutional and economic framework of the country to fit its political theories. Such legislation, unobjectionable in war, was contrary to the spirit of the prewar parliamentary procedure in peace and took much authority out of the hands of parliament to put it into the hands of ministers or even comparatively junior civil servants.

At first such legislation, interpreted by the courts of justice, was never unfairly hard on the individual, but as time went on the framers of these regulations began to alter them whenever a decision of the courts went against them and so to observe the fullest subservience of the written laws to the ends either of the political parliamentary majority or of the various ministries. This apparent encroachment on the liberty of the individual in peacetime was thought by many to be necessary in the interests of increasing state control and of a planned Socialist economy, but it was resented by others and distrusted as tedious and fundamentally contrary to the spirit of British justice. Another apparent encroachment on the individual's right of recourse to the law courts in the last instance was the formation of nonjudicial tribunals (such as the rents tribunals for furnished houses), which had jurisdiction in their own spheres exclusive of the courts of law and without any rights of appeal against their decisions. Such tribunals, presided over, by persons who probably would not have become judges, were not welcomed by the legal profession; as temporary expedients they were justified, but they were

not generally considered satisfactory developments of the previously existing system.

Law based on regulations had become so extensive during the war and printing facilities so restricted, that British citizens might find themselves charged with an offense and unable to obtain sight of a print of the regulation under which they were charged; this state of affairs, however, came to an end soon after the war.

Legislation by regulation and establishment of nonjudicial tribunals made the legislature and the executive dominant partners in the trio of legislature, executive and judiciary which in 1936 had been considered to be each of equal importance in their own spheres and, to some extent, mutual checks. The period 1939 to 1946 brought the judiciary into an inferior position in the trio, with much less influence than it had held before. This change of position suited the ruling elements, but was an innovation as far as the working of the constitution in peacetime was concerned.

The establishment of more ministries and more state boards and authorities, necessary both for the nationalization policy which was being carried out by degrees after the war and for the purpose of increasing the standard of living of the poorest at the expense of the richer, brought into prominence the question of crown litigation. The earlier doctrine was that ministers, ministries and state boards could not generally be sued by the individual in the courts unless an act provided that a particular minister, ministry or board could be sued. With the increase of such bodies an individual was apt to find his rights confusingly different if, for example, he was knocked down by a vehicle driven by another private citizen, from those rights if he was knocked down by a vehicle owned by a ministry which could not be sued. This problem had reached a climax by the end of 1946, and legislation had been foreshadowed but not passed to deal with the problem. Such legislation was also required if two such bodies wanted their disputes referred to the courts, for them to take on the duty of deciding between two public bodies (as was so common in the U.S.S.R. even before 1937) in addition to their more usual role of deciding between two private citizens. Politics became more and more connected with law, and the view was widely held that judges not in sympathy with Socialist views might be unsuitable to administer Socialist laws; this view (which would have been truistic in the U.S.S.R.) was regarded as a dangerous innovation by the more conservative elements in Great Britain and was not acceptable to many lawyers of no particular party affiliation. A school of lawyers arose who wished the judiciary to become a servant of the state acting primarily in the interests of the state and helping the state to administer its own various departments (much as in the U.S.S.R.) rather than that the judiciary should be paid only by the state and primarily used to supply impartial arbitration with binding effect to two parties who could not agree and who would normally be private persons, but one of whom might occasionally be a state department. The latter view of the law became predominant. Appointments to high judicial position were, however, made after the war solely on merit, a factor which prevented the intrusion of politics too deeply into law, and also an innovation, since before the war the highest judicial offices had normally gone to a lawyer in favour with the party in power.

Three other important features were reforms long overdue. First, more concerted attempts than before were made to overhaul the law as it stood; company law and

divorce law, for example, were considered by highly competent and impartial committees with a view to revision, and recommendations of these committees began to be made effective in 1946. Second, the extension of legal assistance of all types to poorer persons was undertaken and the problem of cheaper litigation for those who could not otherwise afford recourse to the law began to be solved. Third, successful efforts were made by administrative steps, by rules of court and by legislation to cut down the time taken to bring to trial nearly all types of cases.

U.S.S.R.—In contrast with the United Kingdom the U.S.S.R. was faced with very different problems of legislation, and different answers to the problems were found. One of the most important reasons for different solutions was the fact that a law of general importance and applicability in the U.S.S.R. had to be designed to cover the inhabitants of an area, with communications not fully developed, of 8,000,000 sq.mi., including peoples of many different races, customs and climates, while in the United Kingdom there were entirely separate legal systems (with mutually exclusive jurisdictions and often completely contrasting laws) for each of six countries—England and Wales, Scotland, Northern Ireland, the Isle of Man, Jersey and Guernsey.

It was to be expected, therefore, that a greater degree of detailed allowance for local customs and difficulties would be given in United Kingdom legislation in cases where similar allowances could not possibly be made in the U.S.S.R., in which wider discretion had to be permitted to judges and officials in the interpretation of laws. A second important reason was that the U.S.S.R., although a European power, was also an Asiatic power; the centre of government and so of legislation was, it is true, in Europe, but after the internal stabilization in the interval between 1917 and 1937, the Asiatic elements of the population had been able to make themselves more and more considered in any question affecting the whole union. Asiatic Russians were able to begin exercising some influence of their needs on solutions to legislative problems. The union included populations stretching as far east (from the point of view of a European) as those of China, and was therefore much more affected by the oriental outlook on law than was any other country in Europe; Turkey, the only other country which stretched into Asia, was avowedly westernizing itself (which the U.S.S.R. was not) during this period; the U.S.S.R. was therefore to be considered as far more oriental in outlook than the remainder of Europe.

Unification of the republics and internal organization and co-ordination reached a higher level in 1940, owing to the war, than ever before; these two considerations, vast area and oriental outlook, accordingly exercised more influence on soviet legislation than ever before and were the key to a proper appreciation of legal developments in the U.S.S.R. The eastern Russian population, too, was the least disturbed after 1940 by the war and so benefited from developments proportionately more than the western and became more nearly equal in importance to the western populations, which had before been the dominating, more advanced, more prosperous and consequently more influential elements.

The period 1937 to 1946 in the U.S.S.R. began with a continuation of the settling down of administered justice to something like that in European countries. The need for using the courts (like every other available means) to enforce the new political system had gone, and the advisability of continuity in legal decisions and of the citi-

zen being reasonably able to foretell the decision of a court began to be felt. The principle under which a soviet judge previously had been able to extend any enacted law to circumstances which the words of a law did not cover but which the spirit of that law appeared to a judge to cover, began to fall into disrepute and disuse. Although extensions of this sort continued, they were applied only in cases where the legislators had obviously omitted some particular phrase and so failed, in so many words, to cover an offense; these extensions were much less frequent than before, in order to allow the citizen to be able to know in advance and with greater certainty how he stood as regards the law.

This type of security was deemed good for the worker and so desirable, not because it helped an individual but rather because it produced a more satisfied (and so a better) worker for the state.

Punishments for the individual criminal became even more based on the corrective view; it was considered wrong to punish as retribution for past evil-doing, and right to correct and restore the individual wrongdoer to useful employment as a citizen. Educational rather than penal treatment of convicts increased greatly, since guilt as such was not recognized; a crime was regarded rather as an upsetting of state routine and the criminal as a child who had to be led into the paths of usefulness. Labour shortage (in the sense that there were always more jobs to do than people to do them) made it essential that all available labour should not only be used but should as far as possible be willing to co-operate; and the punishment of having to stay at his job and pay part of his wages as a fine (i.e., the deprivation of the right to give his work freely to whatever industry he chose, and a diminution for a period of his reward from the state) was more widely used, in preference to imprisonment.

The increasing political and economic stability of the regime allowed a greater use of this less severe punishment, which before might have been inadvisable in the interests of political stability. Re-education of criminals became the dominating idea in soviet criminal justice, except in cases where it was apparent that no amount of re-education could make the delinquent a useful citizen, when he was regarded as an enemy of the state and liable to an appropriate penalty.

From 1930 the position of judges (still elected by the people) became more secure in that they could be removed from office only in extreme cases. In minor cases they were not punished for shortcomings and were left in office.

Labour shortage in increasingly stable conditions brought into the limelight two types of offense which in the rest of Europe were more usually punished in fact by loss of position than in law by legal penalties; these were bad management by factory and similar managers, and bad attendance at work by other workers. It became necessary in 1938 to punish these crimes by exemplary sentences since the automatic punishment of being dismissed by the employer did not occur in the U.S.S.R., where there was one employer only, the state. The war demanded ever greater severity in respect of these types of crime.

Three other aspects of soviet criminal justice were remarkable. First, a large number of criminals did actually surrender themselves in the hopes (which were justified) of exceptional consideration for so doing, re-educational rather than retributive treatment and complete rehabilitation after the end of their sentences with the full opportunity of being useful citizens. Second, it appeared to become more and more the accepted practice to investigate fully the facts and merits of criminal cases before the trial

of the offender, so that by the time the trial was reached the result was nearly always a foregone conclusion; instead of determining the guilt or innocence at the trial, the guilt or innocence had apparently usually been established to the satisfaction of all (including even the criminal himself) before the trial, which then became a formality as regards the pronouncement of the verdict and directed rather to the ascertainment of the correct sentence or treatment of the criminal; this accounted for the surprisingly large number of confessions at trials. Third, the war brought to members of other European nations some experiences of the treatment of military offenses in the soviet army; these were of a severity unparalleled in western Europe, since the efficiency of the fighting forces in the war was of such vital importance that lack of the best military discipline became a menace to the state itself and so a supreme wrong.

The oriental disregard for the life of a human being as such (when the safety of the state might be affected) produced an extreme harshness of military discipline not found, for example, in France, but not differing in kind from that necessary for Tito's forces in Yugoslavia or British forces in the far eastern jungles, though still much severer in degree. Death by shooting for officers drunk on duty or for theft by convoy drivers of vital stores entrusted to their charge, or having to sit on ice without trousers (and so freeze to death) as a punishment for military irregularities further north, were examples of the higher degrees of discipline required and the severity of punishment for its breach. These types of punishment contrasted sharply with those of the British troops, for example, where sentence of death was never given for desertion in World War II, contrary to the practice in earlier

Increasing stability also affected the application of the soviet family laws. Divorce, though still as easily available in theory, was discouraged in practice, and additional formalities and fees made it more difficult to obtain after the end of World War II. Education ceased in 1944 to be required by law to be the same for both sexes, and the special needs of each were recognized. Women were to be trained for motherhood, which became a profession, aided by laws granting distinctions and financial aid to mothers of large families. These laws applied equally to married or unmarried mothers and were partly caused by the need for increase in populations depleted by the ravages of war. Irregular marriages (recognized only in the western parts of the U.S.S.R.) based solely on cohabitation, ceased to be recognized in 1944, since the main purpose of their recognition had been to ensure provision for otherwise portionless illegitimate children whose interest and support had by then become primarily the duty of the state, not of the individual father. Increased taxation on childless adult men and women was another incentive to production of children. Since in the U.S.S.R. the interest of the state preceded all else, the full recognition of unmarried motherhood as honourable was in no way contrary to encouragement of the institution of marriage, for which increasingly full legislative support was forthcoming. This recognition of unmarried motherhood was only a particular aid in overcoming a particular evil (shortage of population) which might well be temporary. Legislation continued to support regular marriages as against marriages according to the less equalitarian principles of some of the Asiatic parts of the union; these parts, in which marriage had generally been polygamous until recent times, were a complication and difficulty in soviet family legislation which was scarcely encountered elsewhere in Europe.

The period 1937 to 1946 in the U.S.S.R. was therefore one of gradual detachment of law from politics, tempered by the necessities of an economic recovery from the destruction and depopulation caused by the war. (See also International Law; Judiciary, British; Supreme Court of the United States.)

Lawrence, Ernest Orlando

Lawrence (1901-), U.S. physicist, was born Aug. 8, 1901, in Canton, S.D. He received his bachelor's degree at the University of South Dakota in 1922, Ph.D. at Yale university in 1925, was awarded honorary degrees as a doctor of science by a number of leading universities in the United States, and was a National Research fellow in physics at Yale from 1925 to 1927. He was appointed assistant professor of physics at the University of California in 1927, becoming a full professor in 1930. An authority on nuclear, biological and medical physics, he was a pioneer in the development of the cyclotron-his first model, weighing 60 tons, was built in the late 1920s. Subsequently he designed a 200-ton mechanism and for this achievement, in addition to his atomic research, he was awarded the Nobel prize for physics in 1939. He became a member of the consulting board of the Institute of Cancer Research at Columbia university in 1935, and was awarded a number of medals for his work in atomic research and related fields. Dr. Lawrence played a prominent role in the development of the atomic bomb. He was also a member of a four-man advisory group which assisted a special U.S. government interim committee on the postwar direction, control and use of atomic energy.

Lead

The wartime gaps in the world production tables for lead had been nearly all filled at the end of the decade 1937–46, except that totals were still lacking for 1944 and 1945.

It is to be noted that while production decreased 13% in 1944 in the countries reported, the trend was reversed in 1945 with an increase of 3%.

Mine production of lead in the United States dropped 60% during the depression years, and had not recovered by the end of the decade. In 1937 output was still a third lower than in the peak year of 1926, and after the recession of 1938 even the pressure for war production failed to bring an output larger than that of 1937, except in one year—1942. After the war peak, mine production continued to decline. Preliminary estimates gave a total of about 330,000 tons in 1946, a decline of 15% below 1945, as compared with drops of 6%, 8% and 9% during preceding years. While the rate of decline was decreasing in 1942—45, it was stepped up to a higher bracket in 1946.

Part of this decline in U.S. mine output was offset by the importation and smelting of foreign ores; ore imports declined after 1940, and supplies were maintained by increased metal imports and some improvement in secondary recovery. Consumption reached a peak in 1944, at a point 65% higher than in 1937, and in 1945 dropped back moderately. In 1944 and 1945 U.S. mine production supplied only 37% of the current consumption, against 48% in 1942 and 68% in 1937.

Ore reserves were too limited to meet the war demand, and in addition the price was inadequate to meet increasing costs—a difficulty that was only partly offset by the Premium Price plan, a procedure designed to meet costs for producers whose operating costs were above the ceiling price. The proportion of the total output produced at ceiling price dropped from 82.6% in 1942 to 66.6% in 1943, 49.7% in 1944 and 37.9% in 1945. All told, the domestic production under the Premium Price plan, from Feb. 1, 1942, to Dec. 31, 1945, amounted to 675.069 tons out of a total of 1,691,903 or 40%, as compared with 21% for copper.

After the scrapping of price controls in Nov. 1946, the New York quotation on lead was advanced from the controlled price of 8.5 cents per pound to 10.5 cents, and then to 11.8 cents. This new price gave some promise of helping to overcome the postwar shortage of lead, which was almost as bad as the war shortage.

In Canada lead production reached its peak in 1942 with an increase of 22% over 1937. Production declined in 1943 and 1944 but recovered some ground in 1945. Even including the increase in 1945, production was below the 1936 level. The improvement of 1945 extended into 1946, with mine production for the first three-quarters at 139,-236 short tons, 13% more than the same period of 1945.

Production of lead in Mexico during the decade was so erratic that it could not be said to have shown any definite trend. In 1938 Mexico made an advance over 1937 that was greater than in any other country, only to be followed by declines that cut output almost in half by 1941; 1942 and 1943 brought increases, 1944 declined and 1945 came back to a point 4% under 1937, but 36% more

than the low of 1941. In 1946 there was another break, with refinery output for the first three quarters 124.595 short tons, against 224,925 tons in 1945.

In Australia there was no great improvement in lead output in response to war demand. The high point of the decade was in 1939, followed by a heavy drop in 1940 and a mild recovery in 1941; then followed successive declines in 1942, 1943 and 1944, broken by a 2% increase in 1945. In the first three-quarters of 1946, refinery output was 113,-477 short tons, 13% under the average rate for 1945. (See also METALLURGY: MINERAL AND METAL PRO-DUCTION AND PRICES.)

(G. A. Ro.)

League of Nations

The years 1937-46 witnessed the collapse and final dissolution of the League of Nations. The first symptoms of its decay had become discernible when, in 1931, through the irresolution of its chief members combined with the aloofness of the U.S.A. (not a member), it failed effectively to protect China against Japan's aggression in Manchuria. The ineffectiveness of the League's system of collective security became even more visible in 1935 and 1936. When in 1935, Italy invaded and conquered Ethiopia, the chief powers showed themselves reluctant to enforce the principles of the League's covenant against an aggressor who happened to be a major power. The same experience repeated itself in 1936, when Germany remilitarized the Rhineland, in open violation of the treaty of Versailles.

The lesson thus provided was not lost on many of the smaller powers, and an increasing number of states, particularly in Latin America, withdrew from membership; others were compelled to withdraw under pressure by their axis neighbours; a third group of countries ceased to be members as the axis powers or the U.S.S.R., by invasion, occupation or annexation, deprived them of political independence. After January 1, 1937, the League gained only one new member, Egypt, which joined on May 26, 1937. Withdrawals during 1937-41 were as follows:

Country	Date of Withdrawal Notification
El Salvador	Aug. 11, 1937
Italy	Oct. 11, 1937
Austria	March 21, 1938
Chile	May 15, 1938
Venezuela	
Hungary	April 11 1090
Peru	
Albania	April 10 1090
Spain	May 7 1090
Rumania	Tuly 11 1040
Denmark	July 27, 1940
France	

Under the covenant (article 1, paragraph 3), notice of withdrawal from the League took effect two years after the date of notification, and the above withdrawals therefore became effective only in the years 1939-43. Paraguay in 1937, and Guatemala and Honduras in 1938, left the League in consequence of withdrawal notices given in 1935 and 1936 respectively. In a class of its own was the case of the U.S.S.R., which in consequence of its attack on Finland was expelled from the League on Dec. 16, 1939.

The total official membership of the League fell from 57 on Jan. 1, 1937, to 54 on Jan. 1, 1939, and to 40 at the time of its dissolution in April 1946. The official membership figures were not, however, an indication of effective membership, by reason of the two-year period of notice which applied to withdrawals, and also the fact that a number of states, still counted as members, had in fact lost their independence (Estonia, Latvia and Lithuania in 1940).

The League had never been fully universal. Thus, the U.S.A. had never become a member; Germany had not joined until 1926, and left in 1933; the U.S.S.R. only joined in 1934. During the critical years 1938–39, the following great powers were outside the League: the U.S.A., Germany (left 1933), Italy (left 1937), Japan (left 1933). At the end of 1939, with the expulsion of the U.S.S.R., another great power departed.

Impotence.—With confidence in the League badly shaken as a result of the Manchurian and Ethiopian affairs and, even more so, Germany's coup in the Rhineland (March 1936), a movement developed to "reform" the covenant which led to a debate at the meeting of the League's council in Jan.-Feb. 1938. The proposed reform of the covenant aimed in reality at the weakening of its key article (article 16) which provided for automatic and obligatory economic sanctions against a covenant-breaking state and for optional military sanctions. Failure effectively to enforce economic sanctions against Italy in 1935-36 had shown that the smaller countries, in trying to apply such measures against a powerful aggressor, exposed themselves to considerable risk without securing in return an adequate measure of collective security. It had become clear, by then, that collective security was worth no more than

"Gloom in Geneva." An allusion to Anthony Eden's championship of the League of Nations before his resignation as British foreign minister February 20, 1938; cartoon by Thomas in the Detroit News. The league ended its 26 years of existence in April 1946

the support given it by the major League powers and that such support was not forthcoming against another great power. Hence, in Jan.-Feb. 1938, an attempt by Sweden, the Netherlands and Switzerland, with which Poland showed a measure of sympathy, to remove the automatic character of economic sanctions. This move reflected the weakening in the League's influence and stature. This very argument was indeed openly invoked when in May 1938, Switzerland, through its foreign minister, Giuseppe Motta, requested express recognition of Swiss neutrality and claimed to be exempted in the future from participation in sanctions under article 16. Significantly, this demand was granted by the League's council on May 15, 1938, although it was fundamentally in contradiction to the very principle of collective security on which the League was based.

When civil war broke out in Spain (July 1936), and when Japan, in July 1937, began its attack on China which was to lead to an eight-year war, the Spanish republican government and the Chinese government appealed to the League for assistance, without securing any practical results. By then, all the major powers had proved their unwillingness to fight wars for interests wider than their own. In later international conflicts, the League was completely by-passed. This was the case when Germany invaded and annexed Austria (March 1938); occupied the Germanspeaking districts of Czechoslovakia under the Munich agreement (Oct. 1938); and occupied and turned into a protectorate the remaining territory of Czechoslovakia (March 1939). Similarly, when Italy invaded Albania (April 1939) and Germany began World War II by its attack on Poland (Sept. 1939), no one thought of the League. When the U.S.S.R. attacked Finland (Nov. 30, 1939), Finland's appeal to the League (Dec. 2, 1939) proved to be the last instance of its kind. The council expelled the U.S.S.R. on the ground that by its aggression against Finland it had "placed itself outside the League of Nations." The practical effect of this expulsion was nil.

During World War II, the League ceased to play any political role whatever. Its secretary-general, Joseph Avenol (French) resigned his post on July 26, 1940. In the technical field, the League from July 1940 to April 1946 continued its valuable work at Princeton, New Jersey, U.S.A., where its departments of finance and economics, health and opium control had moved on the invitation of Princeton university. Sean Lester (Eire), deputy directorgeneral, acted as secretary-general during that period.

The 21st and last assembly of the League met in Geneva from April 8 to 18, 1946. Of the 40 member states then left, 31 were represented to receive the report of the acting secretary-general on the League's work during the preceding six years, formally to dissolve the League and to transfer its assets, among which the Geneva building of the League was one of the most valuable, to the United Nations (q.v.) its successor.

Balance Sheet.—Many critics, not all of them politically disinterested, put the blame for the collapse of collective security on some alleged constitutional defects of the League. In retrospect, such criticism appeared in the main unfounded. Despite the absence from Geneva of the U.S.A. the League achieved a number of solid political results during the first phase of its existence. During the years 1920–31, it contributed materially to the stabilization of the new Europe created by the treaties of Versailles, St. Germain-en-Laye, Neuilly-sur-Seine (1919) and Trianon (1920) and secured the peaceful settlement of nu-

merous conflicts which might easily have degenerated into war. This was in particular the case of the Corfu incident of 1923 between Italy and Greece and, even more so, of the Graeco-Bulgarian frontier incident of 1925. There were other cases of successful League intervention during its first phase such as the settlement of the dispute between Sweden and Finland over the Åland Islands (1920–21), the halting of a Yugoslav attack on Albania (1921), the settlement of the status of Memel (1923–24), although it had to record failure in the dispute between Poland and Lithuania over Wilno (Vilnius) in 1920–23.

In general, it may be said that the League succeeded as long as the major powers among its members stood firmly behind the covenant. As it was not a world state with a sovereignty transcending that of its individual members, effective League action required a wide measure of agreement among its principal members. Such agreement was all the more necessary as military sanctions, under article 16, paragraph 2, could only be "recommended" by the council, and the League did not possess military forces of its own that could have been used for the enforcement of collective security. France, for many years, advocated the creation of an international force to be put at the disposal of the League, but without success.

It was inaccurate, therefore, to blame the League as such for failure. In fairness, this indictment lay not against the League, as the embodiment of collective security, but against its member-states which failed to abide by the covenant to which they had solemnly bound themselves.

Nor was the record of the United Nations, as the League's successor, such in 1945-46 as to excuse so unfair an appraisal of the League's achievements. Indeed, the San Francisco charter, from which the United Nations took its authority, restated in all its essentials the principles of the covenant. And, as in 1946, the new organ of collective security had not yet been put to any major test, it was then still doubtful to what extent its action would prove more effective than that of its predecessor. The main advance of the San Francisco charter on the League covenant lay no doubt in placing an international force at the disposal of the United Nations. But, on the other hand, not only the military, but also the economic sanctions became optional under the charter. As under the Geneva covenant the application of both depended in fact on the unanimity of the great powers. In the absence of such unanimity, the veto of one of them would in fact leave international affairs substantially in the same state of anarchy as before. (See also Mandates; Narcotics and NARCOTIC TRAFFIC; PERMANENT COURT OF INTERNATIONAL JUSTICE; UNITED NATIONS.)

Leahy, William Daniel

Leahy (1875—), U.S. naval officer, was born at Hampton, Ia., on May 6, 1875, and was graduated from the U.S. naval academy at Annapolis in 1897. He was named chief of the naval bureau of ordnance in 1925, chief of the bureau of navigation in 1933, and chief of naval operations in 1937. He was promoted to the rank of full admiral in 1936. Upon his retirement from the navy in 1939, he was appointed governor of Puerto Rico. He then served as ambassador to the French government at Vichy from Nov.

1940 to April 1942, when he was recalled in protest against Vichy's policy of collaboration with Germany. In July 1942, President Roosevelt named him his chief of staff. Leahy was promoted to the five-star rank of admiral of the fleet in Dec. 1944. He had accompanied President Roosevelt to the international conferences held at Quebec, Cairo and Tehran in 1943, and in 1945 participated in the Potsdam parley at Berlin. He remained as chief of staff to President Truman, and was named to the National Defense council in March 1946.

Lear, Ben

), U.S. army officer, was born May 12, Lear (1879-1879 in Hamilton, Ont., and was taken to the United States by his parents while still an infant. After being graduated from high school in Pueblo, Colo., he became a printer's devil. Joining the U.S. army during the Spanish-American War (1898) he served in the Philippines and was commissioned a second lieutenant in 1899. After four and a half years in the Philippines, he returned to the U.S. and was stationed in Cuba in 1906. He served in World War I and in World War II was made commander of the 2nd U.S. army in 1940. It was while in this post that Lear severely disciplined some troops in a motorized regiment returning from manoeuvres in 1941 who shouted "yoo-hoo" to girls as they drove past a Memphis golf course. Terming the conduct of the soldiers a "disgrace to the army" Lear forced the troops to walk 15 mi. as punishment. The incident caused some criticism in congress, although the affair subsided shortly.

In 1943 Lear was made temporary commander of the army ground forces and in 1945 he was made deputy commander to Gen. Eisenhower. The war department announced Lear's retirement from the army in Oct. 1945.

Leather

The leather industry was one of the first major world industries to be affected by impending war, and later by war itself and the demands of military procurement. Few other industries were called upon to make a greater effort to produce for military use and at the same time meet a substantially increased civilian demand. This the leather industry accomplished under many war-created difficulties. In the postwar period, however, the industry found itself in another unique position. Having served its civilian market exceedingly well during the war years, having contributed greatly to the military needs of war, and having earned much respect and good will, it entered the postwar period with both its productive ability and its major markets threatened by seriously undermining conditions.

Statistics on world conditions in the leather industry were not yet obtainable for the years 1941 through 1946, and much of the information available on world conditions after the start of World War II was incomplete, unreliable or purely speculative.

The relation of the U.S. leather industry to the world industry and three other leading leather producing countries is shown in Table I. No later production statistics were available in 1946 for the foreign or world industries, but it was believed that in spite of the urgency of war needs in the belligerent countries, leather production throughout the rest of the world declined somewhat, and in some areas declined greatly, between 1939 and 1946, while the U.S. leather production rose in that period.

Table II shows how a high rate of production was maintained by U.S. tanners through the war years, in contrast with assumed declines elsewhere.

Leather production was based as usual not only upon

demand, but also upon the supply of raw stock available. That raw stock supply remained dependent upon meat production and amount of livestock available for slaughter. How much the leather industry was affected by the fluctuating supply of raw stock was spectacularly proved in the summer of 1946, when a drastic curtailment in the numbers of livestock sent to slaughter resulted overnight in an equally drastic cut in raw stock supply and leather production, forcing many tanneries and shoe factories to suspend or curtail operations.

Table II.—U.S. Leather Production, 1941-45 (000's omitted)

				1941	1942	1943	1944	1945

Calf and kipskins . Goat and kidskins								
Sheep and lambskin								

On this point, the outlook for domestic raw stock supply at the end of 1946 was fair, but the world outlook was not bright. However, estimates of world supply of hides and skins in the years immediately following 1946 varied so greatly that they could not be regarded as anything but the prophecies of well-informed men.

An estimated reduction of cattle in Europe from prewar figures is shown in Table III, which indicates that herds had to be greatly increased before slaughter could reach a level that would satisfy the normal demand for hides and skins.

Analyzing the raw stock situation at the end of 1946, experts predicted a rise in U.S. supplies, and also reported that indications at that time pointed to a world situation not as bad as feared earlier in the postwar period.

L. J. Norton, acting head of the department of agricultural economics of the University of Illinois, reported to the leather industry that domestic cattle population had increased slightly in 1946, and that slaughter was certain to be heavy in 1947 and the years immediately following, unless drought or some other factor drastically reduced herds. Even though the cycle moved downward,

he said, it would still leave the country with total cattle numbers in excess of 70,000,000.

An encouraging report on world conditions was presented by Julius G. Schnitzer, chief of the textile and leather division of the department of commerce, who said that late 1946 reports indicated a world-wide increase in the demand for meat, so the world hide and skin supplies might be higher than in prewar years. According to Schnitzer, the decline in the world livestock position was not as great as had been estimated during World War II. For example, he estimated the world cattle population at 710,000,000 head, or only 2% less than the prewar total, with the heaviest losses in soviet Russia and other European countries.

Against optimistic statistical reports and forecasts, political and economic trends in some of the major hide and skin producing countries during the war had to be weighed. In some of the most important producing countries there was a definite and determined effort to discourage exports of raw stocks, and encourage their manufacture domestically into finished leather and leather goods for domestic use and for export.

Most of the important hide and skin producing areas remained predominantly agricultural. Political leaders of those countries yielded to pressure from economic experts to increase industrial activity and decrease importations of finished products which, if made domestically, would provide employment for large numbers of the population. Such an attitude was sound economically and politically, and could not be regarded lightly by countries like the United States, which had long considered many of the foreign countries involved only as good sources of raw stock supply and good markets for exports of finished leather and leather goods.

From a production standpoint, therefore, the U.S. leather industry entered the postwar period under conditions which indicated that the supply of domestic raw stock would not be large enough to meet the industry's complete needs, and a problematical supply of important raw stock imports. At the same time, consumer demand for shoes and other leather goods in the United States was at an all-time high level in the months immediately following the war.

Tanning.—There were also many changes in the tanning material situation through the years 1937 to 1946. Obtaining tanning material supplies from the far corners of the world, as well as domestic sources, was as complex a problem for the leather industry as was the procurement of an adequate supply of good hides and skins.

During the war, tanning material imports into the United States were greatly affected by wartime shipping difficulties. Active hostilities in some important producing areas also reduced such imports. The increased demand for some materials, notably chromium, by vital war industries also reduced the tanners' normal supplies. At the same time, the high rate of production of military and essential civilian leathers created a need for above-normal quantities of tanning materials.

Many new experiments with various new synthetic tanning materials were made during the war, and also a thorough search for domestic sources of vegetable tanning materials to substitute for those normally imported.

After the war's end, much of this emergency research was abandoned, although some of the synthetic tannins developed or improved during the war seemed destined for wide usage. It seemed doubtful that there would be

any considerable change in vegetable tanning materials used, with a few exceptions. Tannin is contained in practically all forms of plant life, but its extraction from most plant varieties remained commercially impractical, while the tannin in some others was mixed with other substances not conducive to good leather making.

Corn sugar supplies, highly important to leather manufacturers, were low during 1946 and prospect of immediate improvement seemed poor at the end of the year, although the long-range outlook was satisfactory.

With the abandonment of most of the wartime production of arms and essential metal materials of war, the chromium supply situation was satisfactory to the leather industry. The worst shortage was that of chestnut extract, the most important sole leather tanning material; supplies were limited during the war by a lack of labour to produce the material. No long-range improvement in the supply of chestnut extract was visible at the end of 1946 because of the still-unconquered blight that had killed chestnut growth across the country. Only blight-killed trees remained as a source of chestnut tanning extract. The leather industry was fortunate in the fact that little loss of tannin content was shown in blight-killed trees. It was unfortunate in the fact that chestnut reforestation to ensure long-range supplies was impossible while the blight remained unconquered. Much research was done in this direction over a period of years by the department of agriculture, and test growths of imported species of chestnut were watched carefully until their hoped-for resistance to the blight could be determined.

During the war, the chemurgic work undertaken to develop domestic tanning materials reached a high point, with some promising results. Much of this work was carried on by the department of agriculture and by the Tanners Research Laboratory of the University of Cincinnati, which made extensive studies in the usage of proposed new vegetable tanning extracts. The most promising sources of U.S. domestic tannin uncovered by these projects were American sumac, canaigre, guayule, and the bark of the western hemlock and Sitka spruce.

It appeared probable at the end of 1946 that commercial development of these sources of tannin would be expanded.

The U.S. tanning industry had not accepted widely the use of synthetic tanning materials, as was common in Europe. The domestic industry had used them only as tanning aids, or assistants, in conjunction with vegetable tanning materials. The synthetic materials were customarily obtained from industrial wastes, such as the phenols or naphthalene wastes. Waste sulphite liquor of the paper pulp industry, containing solubulized lignin, the noncellosic part of wood, was used in increasing quantities. Lignin is also a waste in such materials as straw or corn stalks.

The situation in regard to oils and fats, important to the tanning and finishing of leather, and also in regard to many leather finishing and dyeing materials, became critical early in the war period as sources of foreign supplies were cut off and domestic supplies were lowered by war production demands, labour shortages, and transportation difficulties. Many of these materials remained in critical supply at the end of 1946, but the lifting of price controls to stimulate production, and a generally improving commodity situation, tended to relieve the shortage.

All government controls were lifted on hides and skins, leather, shoes and other leather goods during the latter

half of 1946, with the exception of some import and export controls. The leather and leather-consuming industries, together with the hide and skin industry, had been among the first to be placed under government controls at the start of the war period. The controls were established to conserve raw stocks and regulate production for all military and essential civilian needs. They covered almost every phase of manufacture and use of leather in minute detail, and were frequently revised to meet changing wartime conditions.

The fact that the U.S. leather industry maintained a high production record throughout the war years under extreme difficulties, and that the military and essential civilian needs of the nation were fully met, without inflation, was evidence of the co-operation that existed throughout the control period between the leather industry and the government control agencies. In this respect, the leather industry established a record through World War II that was equalled by few other industries and bettered by none.

Technological Lag; Scientific Advance.—During the eventful years 1937–46, the science of leather making made great forward strides, but technological development failed to keep pace with scientific progress. The industry devoted more attention in this period than previously to the need for technological improvement, but actual progress in this direction was retarded by wartime conditions.

A considerable proportion of the tanning machinery and equipment in common use was still of heavy types and was neither as intricately built nor as rapid in operation as much of the machinery used by other industries. Therefore it had a longer life; this retarded replacement and probably had discouraged somewhat the development of machinery and equipment over a long period of years.

Even the urgency of war production requirements did not stimulate any substantial rebuilding of the tanning industry or striking advances in leather making technology.

In the scientific field, however, leather manufacture was considered more and more as a science as well as an art. Numerous scientific advances by the leather industry during the ten years gained general acceptance by the industry.

Substantial advances were recorded in the making of bookbinding, upholstery, belting and bag leathers resistant to rot from acids absorbed from the air. A new method of disinfecting hides and skins was developed and adopted, as were improved methods of tanning pigskin leathers for shoe uppers, leading to increased use of those leathers for footwear.

There were noteworthy developments in the tanning and use of leathers from domestic pigskins. Further commercialization of those leathers remained dependent upon increased sources of raw stock supply. This required a change in meat industry practices, as packers commonly processed pork cuts such as bacon, hams, shoulders, etc., with the skins left on.

Tanning of marine leathers, using the skins of various large species of fish for raw stock, also advanced. Wide-spread use of such leather, however, seemed likely to remain a subject for pseudoscientific writers to discourse upon and for the fish industry to dream about. Although much publicity was given to the use of fishskins as raw stock by tanners in Germany, Japan and other countries hard hit by the war, postwar studies revealed that those leathers represented only a small fraction of the total, even during the most stringent raw stock shortages. Marine leathers seemed likely to continue only as novelties.

A new process of curing hides and skins with salt-saturated paper and an addition of antiseptic was announced. Stretchable leather, backed with a woven elastic material, became widely used for the production of several types of articles, especially for uppers of women's shoes. A new type of innersole material, made, of fibre and leather scrap but containing no rubber or latex, was adopted and there were extensive developments in the improvement of sole and upper leather quality.

Many tanning processes were adapted to manufacture of leather for special military purposes, some of which were expected to be commonly employed in production for civilian use.

Research was conducted into the causes of the frequent failure of white shoe leathers. Much of this failure was traced to the use of cleaners, polishes and dressings containing methyl alcohol, ethyl alcohol, water, and such alkaline chemicals as trisodium phosphate, soda ash, ammonium hydroxide, and borax that cause shrinkage. The harmful effects of these were found to be largely offset by glycerine, sulphated alcohols, gums and sulphonated oils, all of which have an affinity for water and tend to prevent shrinkage. The leather industry conducted an intensive educational campaign to stimulate the manufacture and use of cleaners, polishes, and dressings which did not exert a harmful effect on white leathers, with noticeable improvement in this direction.

The oxygen bomb was adopted to accelerate aging during research in developing more permanent leathers, especially those for which a long life was expected, such as book binding, upholstery, bag and belting leathers. With the oxygen bomb test, the leather was exposed in a bomb containing initially an atmosphere of oxygen at 100 lb. pressure per square inch, and aged at 100° C. for seven days.

Énglish leather chemists developed methods for decontaminating leather affected by poison gas. This was one of the war developments in the leather industry for which no wartime use was required. However, other wartime developments along similar lines improved the wearing quality of leather under extreme atmospheric conditions such as prevailed in many of the theatres of war from frozen wastelands to jungle swamps.

Considerable study was made into the causes of gummy spew that sometimes forms on vegetable tanned leathers, and the prevention of this formation. The spew is caused by oxidization and gelation of the cod oil present in the leathers most affected, and is prevented by water solubles in the leather and by free fatty acids, either in currying oils and greases or formed afterwards. Spewing can also be prevented by the addition of anti-oxygens to the cod oil

British research workers developed a white leather made with formaldehyde without preparatory tannage with another material. The leather was full and had a strong grain; it was washable with soap and water and did not become tender upon storage, as did former formaldehyde tannages.

The importance of accelerating technological development was one of the major concerns of the leather industry at the end of the decade. It was pointed out that the time was ripe for rebuilding the physical structure of the

industry, already war-weary and in many instances obsolete.

Keen competition from other materials in the industry's most important markets was also a strong incentive to develop improved tanning machinery and equipment, more efficient techniques, and more effective merchandising policies and practices.

Tanners also foresaw the need for correlating engineering with chemistry. They pointed out that although tanning was essentially a chemical industry, no plant could set a program for greater efficiency and productivity without giving maximum thought to its machinery, plant layout and engineering research.

The quickened enthusiasm of the leather industry for an immediate and adequate revision of many technological and merchandising practices was explained by the potential demand for leather in the postwar years. It was probable that the over-all demand for leather would remain at a high level over a long period, barring sharp economic recessions. Whether the industry could meet all of this potential demand was a matter of speculation at the end of 1946, and depended upon the availability of raw stock. It was certain that leather would receive stiff competition from other materials, many of which were introduced during shoe rationing as substitutes for leather.

Shoes remained the chief market for leather; during the war years and the early postwar period, the demand for shoe leathers was urgent. Shoe production figures for 1946, including estimates for the last quarter, showed that pairs per capita rose 18.9% over the average of the prewar years 1936–40. That increase was attained even with sharp production losses during the third quarter, brought about by the meat shortage and the resultant leather raw stock shortage. In the second quarter of the year, production per capita was 37.8% higher than in the years 1936–40.

A trade authority estimated during World War II that the industry's prewar average of around 400,000,000 pairs a year would rise to a 600,000,000 pair level after the war. A number of factors at the end of 1946 seemed to lend weight to that prediction. There had been a population increase of 10,000,000. Much footwear was made of lighter materials and construction than a decade before, and thus had a shorter life of wear.

The leather industry was concerned because the percentage of cattlehide leather used for shoe production was declining. In 1939, 35.5% of all cattlehide leather was used for shoe sole leather, and 54.9% was used for shoe upper leather. Thus, in 1939, 90.4% of all cattlehide leather was used by the shoe industry. By 1945 those figures had declined, and only 30.9% of cattlehide leather went for shoe soles and 52.8% for shoe uppers. The shoe industry absorbed only 83.7% of the leather industry's most important leather.

The industry recognized the competitive advantages of plastics, synthetics and composition materials as leather substitutes. Frequently they could be offered at lower prices than leather and were uniform in quality. Many of the plants in which they were manufactured were new

and operated with maximum production efficiency. Those factors could be overcome, the leather men felt, only by immediate improvement of the production and merchandising practices of the leather industry.

Trends in the use of nonleather materials for shoe manufacturing are clearly indicated in Table IV, which shows the ratio of footwear produced with leather and with nonleather soles.

The figures in Table IV reveal much of the industry's domestic marketing problem for the postwar years. There was little likelihood of an appreciably stimulated export market such as followed World War I. There might be a reverse stimulus to imports of finished leather and its products. (See Shoe Industry.) (R. B. B.)

Lebanon

Lebanon, an independent republic, is bounded on the north and east-by Syria, on the south by Palestine and on the west by the Mediterranean sea. The population by the census of 1944 was 1,126,601; it was estimated at 1,137,000 in 1945. The capital is Beirut (est. 1943 pop. 234,000). Other cities: Tripoli (70,800); Sidon (Saida) (12,000); Juneh (12,000). The area is approximately 3,600 sq.mi. Arabic is the official language, though French is extensively used by the educated classes. Armenians use their own tongue as well as Arabic. Christians slightly outnumber Moslems, but both religions are divided into numerous sects.

Bishara el Khoury was elected president of Lebanon Sept. 21, 1943. Prime ministers during the decade 1937–46 were as follows: Khair ad-Din al-Ahdah (Jan. 9, 1937–March 20, 1938); Amir Khalid Najib Shihab (March 21, 1938–Jan. 22, 1939); Abdullah al-Yafi (Jan. 23, 1939–Oct. 1939 when the ministry was dissolved by French military decree); Alfred Naccache (May 1941–Nov. 26, 1941); Ahmad ad-Da'uq (Dec. 2, 1941–July 26, 1942); Sami As Sulh (July 28, 1942–March 18, 1943); Ayyub Tabit (March 19, 1948–July 5, 1943); Petro Trad (July 8, 1943–Sept. 21, 1943); Riyadh As Sulh (Sept. 25, 1943–Jan. 9, 1945); Abdul Hamid Al Karami (Jan. 11, 1945–Sept. 30, 1945); Sami As Sulh (Oct. 1, 1945–May 18, 1946); Saadi Al Munla (after May 23, 1946).

"Agreement" with France.-After many months of negotiations, a Franco-Lebanese treaty was initialled on Nov. 13, 1936, providing for recognition of Lebanon as an independent state and its introduction to the League of Nations within three years. France would retain the right to move its armed forces within the country freely. Though the treaty was generally popular, some groups were not enthusiastic about it. A few Moslems opposed an independent Lebanon because they desired union with Syria. Another group, mostly within the Maronite church, advocated outright annexation by the French. However, the strongest political party-the Constitutionalists, containing both Moslem and Christian leaders-was strongly nationalist. They enthusiastically greeted the restoration of the constitution by proclamation of the French high commissioner in Jan. 1937. Elections were announced, and the number of deputies was increased from 25 to 60.

The troubles of Lebanon were deep-seated. Under Turkish rule, the Moslem minority had enjoyed special privi-

leges. French officialdom, however, had identified itself closely with the Maronite church, granting it special cultural and financial privileges, while tending to ignore or discriminate against the Greek (Russian) Orthodox and the Protestant churches, and to reduce the relative importance of the Moslem community. Religious groups bore many characteristics of political parties. Because of the precarious balance between Christians and Moslems in numbers, neither religious bloc felt secure, and both reached out for help from abroad. The Moslems hoped to get inspiration and assistance from the great hinterland of Arabs with which they had easy land connections; at the same time the Christians sought encouragement and help from the western world, particularly France. Lebanon was the only region in the Moslem world where Christians outnumbered Moslems-and that only by a small margin. Christians, therefore, considered themselves a "beachhead" surrounded by the great masses of the Moslem world. They felt it imperative to keep the sea channels open to the western world if they were to survive absorption. Furthermore, since the land is mostly mountainous with a rigid economy, population pressure forced migration: the Moslems to neighbouring states and the Christians mostly to the western hemisphere. Again as a heritage of Turkish days, the government was dominated by the relatively few feudal families who exploited the country's meagre resources. Nepotism was so scandalous that an ordinance was passed limiting the members of a family who could draw government pay. Newspapers were owned by unscrupulous individuals who used them to vilify rivals. Suspensions and fines were commonplace. Thus, when elections were held in Nov. 1937, there was widespread buying of votes after which the top-heavy chamber of deputies assembled but failed to justify its existence.

These conditions gave rise to several nationalistic youth societies. Most aggressive was the secret "National Party" organized by Antun Saadi, a Christian who was convinced that the religious-political tie-up was a curse to the country. He advocated separation of church and state, the unity of greater Syria, radical reforms in education and government and strict discipline within his party. His views were bold and in some ways progressive, but there were other resemblances to totalitarian principles. His party was exposed in 1938, and Saadi fled to South America. But the idea of youth organizations took root in two other societies. The Christians organized the "Phalange Lebanaise" while the Moslems established the "Najjadeh" (Courageous Helpers), both of which grew and developed latent political power. They avoided the excesses which marked the "National Party" and followed more traditional lines.

By early 1939, it was evident that the French would not ratify the treaty of 1936. There were many signs of internal discord and also a series of small irritations when Lebanon and Syria indulged in petty discriminations over the "common interests." But the arrival of French troops in increasing numbers overshadowed local affairs. When war broke out in Europe in Sept. 1939, the high commissioner dissolved the chamber, dismissed the ministry, suspended the constitution and placed Lebanon under military rule. There was little reaction. Excitement and consternation spread in June 1940, when German forces crushed the French armies in Europe. The British hoped that Gen. Eugene Mittelhauser, commanding the forces in the Levant, would declare for the Free French and not adhere to the Vichy government, but on June 27 he ordered a cessation of hostilities. British and other Allied units then withdrew to Palestine in July 1940. The isolation of the French position accelerated economic deterioration.

Lebanese girls reading leaflets dropped by the R.A.F. to inform the people of Allied victories in North Africa at the close of 1942

Vichy Rule Ousted.-In May 1941, German combat planes used Syrian bases for hopping to Iraq to strengthen the abortive revolt of Rashid Ali Al Gailani. The British and Free French were forced to eliminate the axis threat to their flank in the middle east and on June 8, two columns of mixed units attacked from the south. Simultaneously General Georges Catroux, Free French commander, issued a proclamation which included this sentence, "I come to terminate the regime of the mandate and to proclaim you free and independent-your state of sovereignty and independence will be guaranteed by a treaty." Hopes that the Vichy French forces would come over to the Free French were dashed when it became apparent that they were fighting a battle of honour, showing traditional courage. At Marj Ayoun they counterattacked fiercely while at the crossing of the Litani river near Saidi, the Australian column was brought to a temporary halt. By July 10, however, British empire forces were in sight of Beirut, and the Vichy forces capitulated. The bulk of the combat forces chose to return to France, but most of the Vichy political officers chose to join the Free French and retain their positions. They continued to assert authority as though nothing had happened in the preceding five years. The political position of the three states-Great Britain, France and Lebanon-was ambiguous. The British assumed authority for regional military security while the French assumed internal security. To clarify their position, the British minister of state, Sir Oliver Lyttelton, wrote to Gen. Charles

de Gaulle on Aug. 15: "France should have the predominant position—over any other power." De Gaulle replied, "—the pre-eminent and privileged position."

The Lebanese nationalists refused to admit that their independence was conditional upon a French treaty and that any state should have a privileged position. They demanded rapid implementation of the Catroux proclamation. On Nov. 26, 1941, the French officially announced the independence of Lebanon, but for more than a year this declaration remained an empty gesture. The British encouraged an early election, while the French found reasons for indefinite delays. Finally, on March 19, 1943, a temporary government was appointed under Dr. Ayyub Tabit to prepare for elections. There were months of protracted negotiations on the knotty question of proportionate representation. In the electoral list prepared by Tabit, thousands of emigrants had been included. This was challenged by the Moslems, who noted that the emigrants were practically all Christians and that this practice would reduce the proportion of Moslem deputies. Dr. Tabit was finally replaced by M. Petro Trad; the number of deputies was set at 30 Christian and 25 Moslem and the elections set for Aug. 1943.

Franco-British Friction.—An incident during the election campaign exposed the underlying ill feeling of the French toward the British. The "boss" of Tripoli was a rather notorious character, Rashid Muqaddam, who was commonly reputed to be involved in numerous illegal activities, protected his interests with a band of thugs and was considered to be a French tool. After filing his

candidature as a deputy, a British captain and a soldier were caught carrying "hashish" (marijuana) in a military truck. They declared that they were suborned by Muqaddam. A raid upon his summer house yielded 22 tins of the expensive but forbidden extract in his cellar. The British were about to try him before a military court for suborning military personnel when the French insisted on trying him first before a civil court on the charge of smuggling, after which they promised to let the British have him for a second trial. The British consented, whereupon the civil court found him innocent. The French then refused to give him to the British inasmuch as the court had declared him innocent of smuggling, wherefore he could not be tried for suborning on the same count. Muqaddam then resumed his candidature. The British, thoroughly exasperated, put him under military guard and later removed him to Cyprus where he stayed till shortly before his death in 1944. As a result the nationalist Abdul Hamid Al Karami, Muqaddam's rival, won the seat. In revenge the Muqaddam family attempted to assassinate Karami after he became prime minister in Jan. 1945. Such incidents deepened suspicions on the part of all the parties concerned.

The elections were completed in Aug. 1943. In Tripoli, members of the Muqaddam group attempted to threaten opposition by gun play, and in other instances where the vote was in doubt, money flowed freely. The so-called pro-French party was led by Emile Edde, a Maronite who had always been closely associated with French influence, while the anti-French Constitutionalists were led by Sheikh Bishara el Khoury, another Maronite who had distinguished himself in co-operating with liberals and Moslems alike. The latter group swept into office by impressive majorities. The newly elected chamber of deputies met on Sept. 21 and amidst scenes of enthusiasm chose Bishara el Khoury as president. The latter asked Riyadh Bey As Sulh, veteran political leader of the Moslem community, to form a government. On Oct. 7, the government outlined a series of almost radical reforms, among which was that of amending the Organic law. Woven throughout the law were references to the rights of the mandatory power. Lebanon, acting on the thesis that it was now a sovereign state, intended to delete all passages which limited their freedom of action. The French National committee in Algiers argued that such deletions could not be made unilaterally but only upon consultation with the mandatory power and approval by the League of Nations. Weary and suspicious of French dilatory tactics, the chamber met on Nov. 8, hastily decided that the authority to amend the law was vested in the Lebanese government alone, and by a vote of 44 in the affirmative, struck out all mention of French rights. Emile Edde and a few of his party left the chamber.

France's Losing Struggle for Control.—The French delegate general, M. Helleu, retaliated early on the morning of Nov. 11 by arresting the president, most of the cabinet and 48 members of the chamber, dissolving the chamber and establishing a de facto government under Emile Edde. Two cabinet members fled to the mountains and set up a "mountain government" to fight the French. French troops fired upon demonstrators in Beirut. An avalanche of protests poured in on the French from the Arab states and the U.S.A. General Catroux flew from Algiers to Cairo and was bluntly told by the British that the Lebanese government should be restored or the British would declare martial law. The French committee in Algiers was dangerously split, but the majority voted to acquiesce. On the 21st the prisoners were released, M. Helleu was recalled and Bish-

ara el Khoury resumed office with the remark, "We continue as if nothing has happened. There is no constitutional issue." The ill-advised act of the French had united Lebanon as it had never been before, and it had profoundly weakened French prestige. The French blamed the whole affair on British and United States intrigue. They singled out Sir Edward Spears as the instigator of the revolt and George Wadsworth as his abettor. The former was appointed British minister to the Lebanon in Aug. 1944, and the latter U.S. minister on Sept. 8, 1944. The soviet union recognized Lebanese independence in July 1944. However, it was Syria which profited most by the incident, for it learned that to be independent, a state must act independently.

During 1944 there were endless conferences between Lebanese, Syrian and French representatives over the transfer of "common interests" such as communications, railways, antiquities and customs. In July the French tried to get agreement on a "university convention" to rivet French cultural controls upon Lebanon (which the latter refused) but when the question of transferring the Troupes Spéciales arose, France balked unless Lebanon and Syria would first sign a treaty recognizing French privileges. This Lebanon resolutely refused to do. In this stand they were encouraged by the other Arab states, which sent representatives to Alexandria in Sept. 1944 and set up machinery for establishing an Arab league (q.v.). In March 1945, a second conference was held to approve the Arab League constitution. The Sulh government had fallen in the meantime. It had been charged with corruption and laxity in facing the problems of economic shortages and inflation. In Jan. 1945, Abdul Hamid Al Karami had assumed the office of prime minister and had selected Henri Pharoan, a Greek Orthodox merchant of great wealth and vigour, as foreign minister. Pharoan vigorously insisted on the right of Lebanon to complete sovereignty before he would sign the constitution of the league. The Christian majority in Lebanon did not want the Arab League to become a super-state in which they would become a minuscule minority among 30,000,000 Moslems. Pharoan won his point. Although it weakened the Arab League, it preserved the sovereignty of Lebanon.

Karami energetically attacked the internal problems facing the country. In addition to the perpetual difficulties of Lebanon, the war had imposed three special types of stresses: (1) the Vichy French had sent out all the country's gold, and stocks of imported manufactured goods had been depleted; (2) large Allied armies were in training, and purchases of goods and services had put large sums of paper money into circulation; a military railway had been built along the coast from Haifa to Tripoli, employing many local labourers; (3) most of the deputies and people of political influence were either holders of land or owners of industrial establishments. They were selfishly opposed to price controls, and their wealth had been multiplied many times. Prices in 1945 were 600% of those obtained in 1939. After the liberation of France, French officers and merchants began to buy unusual quantities of goods to send to France-threatening price chaos in Lebanon. Karami went to Gen. Etienne Beynet, French delegate, and arranged to have wholesale shipments to France curtailed. He seized textile mills, reducing the price of yarns by half. But he found his efforts opposed and often frustrated by multiple intrigues on the part of groups of deputies. Riyadh Bey assumed an attitude of opposition and his followers called for repeated votes of confidence. Karami decided that a constitutional change was necessary which would free the cabinet from attacks by lobbies and blocs in the chamber. Thoroughly exasperated by the tactics used against him, after receiving a vote of confidence, he resigned on Sept. 30, after nine months in office. His regime had been one of forthright and honest effort unequalled in modern Lebanese history. It was followed by the colourless and uninspiring government of Sami As Sulh, cousin of Riyadh Bey.

With the end of the war in Europe, France began to send fresh troops to the Levant. The arrival of the first contingent in Beirut on May 17, 1945, lit the fuse which led to the explosion in Syria when the French bombarded Darnascus on May 27-28. British intervention followed two days later. Lebanon was tense, but no major incidents took place. After June 1 began the transfer of French troops and civilians from Syria to Lebanon. Both pro- and anti-French sentiments were intensified by the events taking place. Some Christian leaders identified hopes of their survival with the continuation of French privileges and arms. On e prominent Maronite churchman went to Paris to urge the French to stay in Lebanon at all costs. Another churchman went to Rome to enlist the support of the papacy. But by far the majority of the Christian leaders believed that the association between Christianity and the French empire had become obsolete and perhaps even harmful. They argued that the Christian groups should seek wider cultural bonds with the entire western world. Syria meanwhile recalled how, in July 1920, the French had used Le banon as a base for launching an attack on Syria, wherefore it insisted that the French withdraw from Lebanon

Negotiations between French and British military representatives began on Dec. 13, 1945, but bogged down in misunderstandings and suspicions. Lebanon and Syria then joined in appealing to the Security council of the United Nations in London. On Feb. 16, 1946, the United States representative proposed its policy that no nation keep its armed forces in the territory of another independent state against the desire of its government, suggesting withdrawal of both British and French forces as soon as practicable. The soviet union, hoping to make political capital out of the issue, vetoed the motion, but seven other states approved it. The French and British announced that in spite of the veto, they regarded the majority opinion as mandatory. By June 20, 1946, the last British unit had evacuated and the last French unit was scheduled to leave by Aug. gr, leaving only a few officers and men to finish the task of complete liquidation.

The little land which had, for millennia, been the threshold by which western influences and armies had penetrated the east, and by which eastern ideas and trade had flowed westward, was now a free country. No one expected its future course to be easy. Conflict, struggle, synthesis and compromise had ever been the sine qua non of Lebanese existence.

For statistics relating to Lebanon, grouped together with Syria during most of the decade 1937-46, see Syria. (See also Mandates.)

Leclerc, Jacques

Leclerc (1902-), French army officer and nobleman, was born in northern France. After graduation from St. Cyr academy, he served in French and Moroccan garrisons as a lieutenant, and was a major when the Germans invaded France in May 1940. Wounded and taken prisoner during the campaign, Leclerc managed to escape to England where he joined the De Gaullist forces. (He did not use his full name, Jacques Leclerc de Hauteclocque, after he joined the Allied forces for fear that his family, then in France, would suffer reprisals.) Assigned to a post in the Cameroons, he was promoted to a colonelcy, and was named a brigadier general in Aug. 1941. In late 1942 he led a column of French and native forces that staged a 1,500-mi. trek in 39 days northward across the Libyan desert to join the British 8th army in Tripoli on Jan. 25, 1943. In 1944 Gen. Leclerc and his French 2nd armoured division were in Normandy. His division was the first to enter Paris, and Leclerc himself supervised the surrender of the German garrison in the French capital on Aug. 25, 1944. In 1945 he was placed in command of the French Pacific force, and when the uprising of the Annamese started in Indo-China, he led the French troops in the suppression of the rebellion. Gen. Leclerc was the French representative at the signing of the Japanese surrender articles in Sept. 1945.

Lee, John Clifford Hodges

), U.S. army officer, was born in Junc-Lee (1887tion City, Kan., on Aug. 1, 1887, and was graduated from the United States Military academy in 1909. He served as an officer in the corps of engineers at various posts in the U.S., Philippines and Panama Canal Zone. In 1917 he was aide to Maj. Gen. Leonard Wood, and later became acting chief of staff of the 89th division. He served in France in World War I, saw action in the St. Mihiel and Meuse-Argonne offensives, and after the armistice was with the U.S. army of occupation in Germany. For his service in World War I he was awarded the distinguished service medal and silver star by the U.S. and the legion of honour and croix de guerre with palms by France. He returned to the U.S. in 1919 and was for a time attached to the office of chief of engineers in Washington, D.C.

In 1940 and 1941 Lee was in command of the port of embarkation at San Francisco, Calif. Named major general in Feb. 1942, he was placed in command of the services of supply in the European theatre of operations. In Jan. 1944 Gen. Eisenhower appointed Lee his deputy commander in the European theatre, and in Dec. 1945 Lee was named Mediterranean commander and deputy supply commander of the Mediterranean theatre.

Leeb, Wilhelm Joseph Franz Ritter von

Leeb (1876—), German army officer, was born Sept. 5, 1876, in Landsberg-am-Lech, Bavaria. He joined the army at the age of 19, later serving in the German expeditionary force to China during the Boxer rebellion. Upon his return to the reich, he entered the war academy and served on the German general staff during World War I. Following the war, he participated in the suppression of communist uprisings in Bavaria, after which he rose to the rank of general. In 1935 he was made one of the three army group commanders of Germany, and was assigned to group No. 2 based at Cassel. During Hitler's purge of army officers in 1938, Leeb resigned his post, but was

later recalled to take command of an army of occupation in Czechoslovakia. In 1940 he commanded the German troops on the Rhine, storming through the Maginot line after the collapse of the French armies in the north. When German armies invaded the U.S.S.R. in 1941, he was assigned command of the German armies assaulting Leningrad. Marshal von·Leeb's armies pushed back the Russian forces virtually to the gates of Leningrad in the fall of 1941, but by June 1942 his forces had been completely routed and he was reported removed as commander of the north front in Sept. Leeb was captured by U.S. troops in March 1945.

Leese, Sir Oliver W. H., 3rd Baronet

Sir Oliver Leese (1894-), British army officer, was born Oct. 27, 1894. During World War I he was wounded three times. Having held a number of different staff positions between wars, he was appointed, early in World War II, deputy chief of general staff to the British expeditionary forces. He was evacuated from Dunkirk in a small rescue boat and returned to England with Field Marshal John Gort. In 1942 he went to the middle east as a temporary lieutenant general and commanded the 30th corps of the 8th army in the drive from El Alamein to Tunisia, and later led it into Sicily. He succeeded Gen. Sir Bernard Montgomery as 8th army commander in 1944 when Montgomery was named to head the British invasion forces in England. In Nov. 1944 he was appointed commander of the newly organized 11th army group, which included some U.S. troops formerly commanded by Gen. Joseph W. Stilwell, and which was to operate in southeast Asia under Adm. Louis Mountbatten. One of the youngest corps commanders in the empire, Sir Oliver was created a knight commander of the British empire for his part in the defeat of Field Marshal Erwin Rommel in Africa, and won the Order of the Bath after the Sicily campaign.

Lehman, Herbert H.

Lehman (1878—), U.S. politician, was born March 28, 1878. He was graduated from Williams college, Williamstown, Mass., in 1899. He later entered the textile business and in 1908 became a partner in Lehman Brothers banking house, where he remained until World War I. After serving as civilian assistant to Franklin Delano Roosevelt, then assistant secretary of the navy, he joined the army in Aug. 1917, was commissioned a captain and assigned to the general staff. He eventually attained the rank of colonel in the quartermaster corps and was awarded the D.S.M. in 1919.

After World War I, Lehman returned to the banking business.

Having served two terms as lieutenant governor of New York, Lehman was elected to the first of four terms as governor in 1932. He declined renomination in 1942 and was appointed director of foreign relief and rehabilitation by President Roosevelt. In Nov. 1943 he assumed office as director general of the United Nations Relief and Rehabilitation administration. In spite of a reorganization

of U.N.R.R.A. offices undertaken by Lehman in May 1945, the administration was criticized by many. Lehman vigorously denied charges that the distribution of relief in Europe was often dependent upon Russian political strategy, and urged the need for larger appropriations. In March 1946 he resigned as director general of U.N.R.R.A because of ill health.

LeMay, Curtis E.

LeMay (1906—), U.S. army air officer, was born Nov. 15, 1906, in Ohio. A graduate of the Air Corps Primary Flying school, he enrolled as a flying cadet in the air corps in 1928, and studied at the Advanced Flying school in 1929 and at the Air Corps Tactical school in 1939. He had been commissioned a second lieutenant in 1930, and advanced through the grades to brigadier general in Sept. 1942 and major general in March 1944. After the start of World War II, LeMay was commanding general of the heavy bombardment division of the 8th air force in England.

In Aug. 1944 he was named chief of the 20th bomber command, in charge of B-29 superfortress missions in the China-India-Burma theatre of operations. He received the D.S.M. in Dec. 1944, and was appointed chief of staff to Gen. Carl A. Spaatz, commander of the U.S. strategic air force in the Pacific, in July 1945.

Lend-Lease

The "Lend-Lease act," as it became popularly known, was enacted by congress on March 11, 1941, and became law the same day when the president affixed his signature. The bill was introduced in congress as H. R. 1776 on Jan. 10, 1941, and was entitled "An Act to Promote the Defense of the United States." Passage of the bill on March 11, 1941, followed two months of public hearings and debate in both the house and senate, for the importance of the law as a clear and positive statement of the position of the United States with respect to the European war was recognized by the overwhelming majority of the citizens of the country.

The Lend-Lease act provided that the president might "sell, transfer title to, exchange, lease, lend or otherwise dispose of" defense articles to the government of any country whose defense he deemed vital to the defense of the U.S. The benefit to the U.S. was to be "payment or repayment in kind or property, or any other direct or indirect benefit which the President deems satisfactory." Administratively, the Lend-Lease act permitted the president to determine where arms and other defense articles manufactured in the United States would contribute most to U.S. security—whether it be in the hands of those countries then resisting nazi aggression or in the hands of the military forces of the United States itself.

Within three hours after he signed the Lend-Lease act on March 11, 1941, the president issued two directives putting the lend-lease program in motion. The first declared the defense of Great Britain vital to the defense of the United States and authorized the secretary of the navy to turn over to the British 28 P.T. and P.T.C. motor boats, together with certain facilities for arming merchant ships. The second declared the defense of Greece vital to the defense of the United States and authorized the secretary of war to transfer to the Greeks guns, shells and other infantry equipment.

The first lend-lease funds, \$7,000,000,000, were appropriated to the president by congress on March 27, 1941.

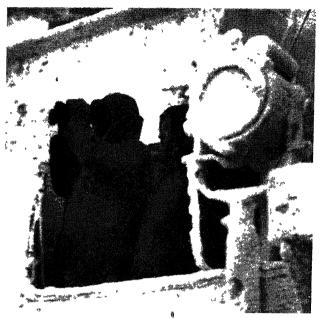

Congress subsequently appropriated an additional \$20,877,937,000 to the president for lend-lease purposes, making a total of such appropriations \$27,877,937,000 during the life of the Lend-Lease act. In addition, congress authorized the transfer for lend-lease purposes of \$35,970,000,000 from appropriations made to the war department and the navy department. Thus, a grand total of \$63,847,937,000 was appropriated by congress for lend-lease aid.

The Lend-Lease act was administered from May 2 to Sept. 16, 1941, by the Division of Defense Aid Reports, in the executive office of the president. On Sept. 16, 1941, Edward R. Stettinius, Jr., was appointed lend-lease administrator. The Office of Lend-Lease Administration was established by executive order on Oct. 28, 1941.

During the course of World War II, 44 countries were declared eligible by the president for lend-lease aid. Total lend-lease aid reported transferred and made available to foreign countries from the beginning of the program on March 11, 1941, through Dec. 31, 1945, amounted to \$50,-692,109,000. Countries receiving this aid and the date upon which they were declared eligible for lend-lease were as follows: Argentina (May 6, 1941), Australia (Nov. 11, 1941), Belgium (June 13, 1941), Bolivia (May 6, 1941), Brazil (May 6, 1941), Canada (Nov. 11, 1941), Chile (May 6, 1941), China (May 6, 1941), Colombia (May 6, 1941), Costa Rica (May 6, 1941), Cuba (May 6, 1941), Czechoslovakia (Jan. 5, 1942), Dominican Republic (May 6, 1941), Ecuador (May 6, 1941), Egypt (Nov. 11, 1941), El Salvador (May 6, 1941), Ethiopia (Dec. 7, 1942), France (Nov. 11, 1941), Greece (March 11, 1941), Guatemala (May 6, 1941), Haiti (May 6, 1941), Honduras (May 6, 1941), Iceland (July 1, 1941), India (Nov. 11, 1941), Iran (March 10, 1942), Iraq (May 1, 1942), Liberia (March 10, 1942), Mexico (May 6, 1941), Netherlands (Aug. 21, 1941), New Zealand (Nov. 11, 1941), Nicaragua (May 6, 1941), Norway (June 4, 1941), Panama (May 6, 1941), Paraguay (May 6, 1941), Peru (May 6, 1941), Poland (Aug. 28, 1941), Saudi Arabia (Feb. 18, 1943), South Africa (Nov. 11, 1941), Turkey (Nov. 7, 1941), United Kingdom (March 11, 1941), U.S.S.R. (Nov. 7, 1941), Uruguay (May 6, 1941), Venezuela (May 6, 1941), Yugoslavia (Nov. 11, 1941).

Lend-lease aid furnished by country was as follows:

On Sept. 25, 1943, the Lend-Lease administration was transferred to the Foreign Economic administration and Leo T. Crowley was named Foreign Economic administrator.

On Oct. 20, 1945, the Foreign Economic administration was abolished and the then remaining lend-lease functions were transferred to the department of state.

Four months after the termination of hostilities, on Dec. 6, 1945, a lend-lease settlement was agreed upon between the United States and Great Britain. The settlement provided that "the net sum due from the United Kingdom to the United States for the settlement of lend-lease and re-

Reverse lend-lease equipment for aircraft of the U.S.A.A.F. at a British air depot. This picture shows part of the stores of gas tanks and flame dampers earmarked for U.S. planes operating in the European theatre

ciprocal aid, for the acquisition of surplus property, and the United States interest in installations, located in the United Kingdom, and for the settlement of claims shall be \$650,000,000," subject to certain accounting adjustments.

The lend-lease settlement with France was concluded on May 28, 1946. In addition to finally disposing of the accounts for lend-lease and reciprocal aid, the agreement settled all outstanding claims between the two governments arising out of the war. On the balance of these accounts and claims, France undertook to pay the United States \$420,000,000.

The final settlement with India for lend-lease, reciprocal aid, and surplus war property located in India, and for financial claims of each government against the other arising as a result of the war was signed on May 16, 1946. It was agreed that no payment would be made by either government for lend-lease and reciprocal aid items made available to the other government.

The final settlement of the lend-lease and reciprocal aid accounts with Australia was signed on June 7, 1946. The agreement provided there should be no payment by either government to the other for the goods and services transferred.

Leningrad

During the short Russo-Finnish War of 1939-40, Leningrad, the old capital of tsarist Russia, was bombed by Finnish planes with propaganda leaflets to show the ease with which it could be hit with explosives. But after the German attack on the soviet union on June 22, 1941, the city became the target not only for destructive air raids but for axis long-range artillery. The German drives toward Leningrad were aimed at cutting off the city, appropriating its economic and industrial resources, separating the U.S.S.R. from its allies, and using the city as a pivot for an axis drive north to Murmansk and Archangel as well as for an assault to the south on Moscow. This offensive, then, resulted in one of the major battles of the war and one of the longest sieges. By mid-August, 1941, axis troops had cut the Leningrad-Moscow railway and surrounded the city. Thereafter, for 29 months, many Russian divisions were locked within the city, surrounded by German, Finnish and Rumanian armies that made repeated large-scale attacks in which the city was heavily damaged. The inhabitants, reduced to short rations to prevent famine, barricaded the streets in the event of a major break-through, and continued, amid the confusion, wreckage and suffering, to work day and night in war plants that turned out 46-ton tanks, ammunition and other essential materials. Martial law was proclaimed in the city from the beginning of the assault; old men, women and even children were formed into home-defense troops. The Russians, fighting for their lives, made frequent counterattacks, one of these, in Jan. 1943, forcing a breach nine miles wide and six miles deep through which supplies could be brought in over land routes to ease the threatened famine. By February Russian armies were fighting along a front extending from Leningrad to the Black sea. Though German forces had been at the near approaches of Leningrad for 17 months, nowhere had they penetrated the city to maintain a permanent

B61

hold. The siege was officially declared ended on Jan. 18, 1943, and, though completely wrecked, the city was out of danger.

Leopold III

King Leopold of Belgium (1901-), was born Nov. 3, 1901, the son of King Albert I. He served in World War I and studied at Eton college, England. He was married on Nov. 10, 1926, to Princess Astrid of Sweden, who was killed in a motorcar accident in 1935. On Feb. 17, 1934, he succeeded his father as king of the Belgians. Leopold joined with the kings of Norway, Denmark, Sweden and Holland in a final effort in 1989 to secure peace by mediation. At the start of the German invasion on May 10,, 1940, Leopold assumed command of his armies and appealed to France and Britain for aid. His unconditional surrender of May 28 caused a storm of indignation among the Allies and many of his own subjects. On Sept. 11, 1941, while in captivity, Leopold was permitted to marry Mlle. Mary Lelia Baels, a commoner, who took the name of Princess de Réthy. Several days after the Allied invasion of Normandy in June 1944, the Germans moved Leopold from his palace at Laeken, near Brussels, where he was being held in custody, to a location deeper within the reich. In May 1945 U.S. 7th army troops liberated the Belgian king and his wife near Strobl, Austria. The king's desire to resume his throne was opposed by the Belgian government on charges that his surrender in May 1940 was suspect. Leopold answered that he yielded because he felt that he should stay with his people. Although both houses of Belgium's parliament voted to bar his return, Leopold refused to abdicate. He was said to be waiting for a shift in Belgium's political balance from left to right before making another effort to return to his homeland.

Lepidolite

See LITHIUM MINERALS.

Leprosy

During the period 1937-46, little was added to the already known facts in the aetiology, epidemiology, clinical behaviour and pathology of leprosy. Mycobacterium leprae, the generally accepted cause of the disease, had not yet been successfully cultured either on artificial media or in the presence of living cells. Leprosy research continued to be hampered also by the failure to find an animal in which human leprosy could be produced experimentally. For a short period during this decade there was hope that a Syrian hamster would prove to be the susceptible animal, but again results were disappointing.

Another leprosy "cure" was briefly though widely heralded by the lay press. The diphtheria toxin-antitoxin and toxoid treatment, enthusiastically reported from Siam in 1940, was given prompt and fair trial by leprologists in other countries with almost universal agreement that it was without beneficial effect.

The popularity of chaulmoogra oil and its derivatives in the treatment of leprosy seemed to decline steadily. This drug, used before the 20th century, gained widespread acclaim after very favourable reports made in 1920 by workers in Hawaii. In 1942 an observer who had used it a quarter of a century before made a careful analysis of reports and opinions of leprologists who had used it extensively. He concluded that chaulmoogra oil and its derivatives were of doubtful value in treating leprosy.

The natural tendency of leprosy to heal spontaneously in many cases made evaluation of all therapy very difficult. In general, about 20% of those segregated for leprosy became arrested without treatment. All reports on the beneficial results of any treatment had to be weighed carefully with emphasis on this natural tendency toward healing. Reports on the use of the newer chemotherapeutic agents had to be viewed in this light.

Observers at the National Leprosarium, Carville, La., made detailed studies of cases treated by several sulfone drugs. Sulfanilamide was found to have some effect on the complications of leprosy but none on the disease itself. Promin (a sulfone drug) was used intravenously on a total of 137 patients with encouraging results. Of 42 patients who would be continued on treatment more than 2 years, 73.8% were classified as improved. Another sulfone derivative, diasone, suitable for oral administration, was given to 104 patients. Objective improvement was observed in 65% of those treated 6 months or longer (66 cases). This reported improvement seemed especially significant, as 74.2% of the cases were the type (lepromatous) usually offering the poorest prognosis.

The leprologists conducting these therapeutic experiments did not believe that a "specific" treatment for leprosy had yet been offered. However, they were encouraged by results obtained and were hopeful that more efficacious drugs would be produced.

The antibiotics were also tried. Penicillin in a preliminary report seemed of no value. Streptomycin was also under study.

The succeeding decades would probably see an increase in leprosy in areas where it was not previously endemic. Possibly because of exposure in the West Indies or in the Philippines, 32 U.S. veterans of the Spanish-American War were later admitted to the National Leprosarium at Carville, La. World War II required millions of military and civilian personnel to spend much time in regions where leprosy was prevalent. Some of these people would probably develop leprosy. Lettuce

Commercial lettuce crops continued their steady increase in the United States through the decade 1937–46. Following World War I, the crop began to expand rapidly and in 10 years grew from an annual production of about 4,000,000 crates to 18,600,000 crates. The increases were less rapid for the next 10 years, and in 1937 a crop of 21,135,000 crates was reported. After 5 years another period of rapid increase began, stimulated by the high prices of

the war period; by 1945 the total crop was 29,648,000 crates compared with the 1934-43 average of 21,572,000 crates.

These crops were grown on acreages ranging from 151,-750 ac. in 1937 to 172,650 ac. in 1945 and 185,250 ac. in 1946. The big yields were due to favourable seasons, since as early as 1931 an acreage of 173,300 ac. was planted but the yield was only 116 crates per ac. compared with a yield of 179 crates per ac. harvested in 1943. Methods of culture had improved greatly during the period. The principal stimulus to expansion was the growing demand from consumers with better incomes. The practice of eating midday lunches in war plants, drug stores and other quick-lunch establishments added to the popularity of the green salad. Prices of lettuce to growers ranged from \$1.30 to \$1.80 per crate during the prewar decade and did not increase materially until the United States entered the war. The average price to growers in 1941 was \$1.67 per crate; it was \$2.54 in 1942, \$3.31 in 1943, \$2.57 in 1944 and \$2.92 in 1945. Prices were at the ceiling levels most of the time, and shipments were restricted at times. The U.S. department of agriculture advised a reduction in acreage in 1943, and a smaller acreage was planted; because of good yields, however, the output increased over that of 1942. The output of victory gardens had no evident effect on the commercial demand. The largest increases were in California in the winter and midsummer crops.

Experiments in shipment by aeroplane were tried in 1944 with promising results. Shipments from California to Detroit, Mich., showed that the use of lighter packages would effect a saving. While the fresher product brought quickly by aeroplane sold at five cents per head premium in competition with the rail-shipped product, the conclusion was that airborne products would have to be sold at a premium until costs could be reduced. As soon as air freight rates were adjusted such transportation might become a commercial practice for the highest quality product. The expansion in lettuce production was not that of a single vegetable crop. The 25 commercial truck crops set a new record in 1945, about 12% above the previous record in 1943. In value of the total crop, lettuce was exceeded only by tomatoes. The total value of the lettuce crop to

U.S. Lettuce Production, 1937-46 (In thousands of crates)

	1937	1939	1941	1942	1943	1944	1945	1946
U.S. Total	21,135	24,004	23,042	23,604	24,416	28,690	29.648	34,504
Early winter	5,109	6,670	5,261	5,690	5,723	7,243	7,208	9,387
Early spring	6,527	7,485	6,541	6,904	6,565	8,045	8.558	8.391
Late spring	937	801	925	836	862	1,067	1,012	1,309
Summer	3,737	4,144	5,512	5,209	5,443	6,143	6,596	7.450
Fall	4,825	4,904	4,803	4,965	5,823	6,192	6.274	7.967

growers increased from \$32,666,000 in 1937 to \$80,768,000 in 1943. This income went chiefly to growers in special truck-growing areas, such as southern California, Florida, Texas, etc., and not to widely distributed farmers. The technical improvements in culture, disease control and use of specialized machinery made possible the expansion of the commercial vegetable industry. (See also Vegetables.)

Lewis, John Llewellyn

Lewis (1880—), U.S. labour leader, was born Feb. 12, 1880, in Lucas, Ia., the son of a Welsh coal miner. After seven years of schooling he was compelled, because of his

family's financial need, to leave his studies and enter the mines. His success as legislative agent for the United Mine Workers of America in Illinois after 1909 led to his appointment as American Federation of Labor organizer in 1911. He became vice-president of the United Mine Workers of America in 1917, and in 1920 was named president. Lewis had long favoured the industrial organization of mass-production industries, contrary to the principles of traditional A.F. of L. craft unionism. In 1935 he formed the Committee for Industrial Organization. When he refused to heed the order of the A.F. of L. executive council to dissolve the committee, the participating unions in the C.I.O. were suspended in 1936 and the following year were expelled from A.F. of L. membership. In its 1938 convention, the C.I.O. defined its position and adopted the name Congress of Industrial Organizations.

Lewis supported Roosevelt in the 1936 presidential campaign, but in 1940, in protest against Roosevelt's interventionist foreign policy and a domestic policy considered not too friendly to labour, he threw his support to the Republican candidate, Wendell Willkie, and promised to resign as C.I.O. chief if Willkie lost. He made good his promise and was succeeded by Philip Murray, but he retained the U.M.W.A. presidency. His growing antagonism toward Murray and his dissatisfaction with the pro-Roosevelt activity of the C.I.O. resulted, in Oct. 1942, in the withdrawal of the mine workers from the C.I.O. Lewis made several attempts to return to the A.F. of L. in 1943 and again in 1945, but negotiations between the two organizations were not satisfactorily concluded until Jan. 25, 1946. The U.M.W.A. was readmitted to the A.F. of L., and Lewis was made the 13th vice-president of the parent body and a member of the council.

During the war Lewis risked unpopularity and government intervention when he called the mine workers out on strike in protest against low wages and bad working conditions. Two strikes in 1945 and two in 1946, which had nation-wide repercussions, achieved part of the workers' demands. The last strike of 1946 threatened to cripple the nation's economy and resulted in a \$10,000 fine for Lewis and a \$3,500,000 fine for the U.M.W.A. after Lewis ignored a preliminary injunction forbidding the strike. None of the workers' demands was met, and the case was taken to the supreme court.

Ley, Robert

Ley (1890-1945), German politician, was born Feb. 15, 1890, in Niederbreidenbach, Germany. He studied at the universities of Jena and Bonn, received a Ph.D. in chemistry and worked for I. G. Farbenindustrie for seven years (1921-28), before he was discharged for "political activity." He was elected as nazi member to the Prussian diet in 1929, and to the reichstag in 1932, and was made head of the German workers' front after Hitler became chancellor. During World War II, he supervised the mobilization of foreign as well as German labour for war work. Although he had been named in April 1945 as head of a special Adolf Hitler volunteer corps which was to function as guerrilla fighters, he fled to the mountains near Berchtesgaden where he was captured by U.S. troops on May 16, 1945. He attempted to take his life but failed and was arraigned as a war criminal. On Oct. 25, 1945, he hanged himself with a towel in the Nuernberg prison where he and 23 other nazis were awaiting trial as war criminals. A violent anti-Semite, Ley left a "political testament" which attributed Germany's downfall to anti-Semitism and urged Jews and Germans to reach a "complete reconciliation."
